# EXECUTIVE SUMMARY

Out of an abundance of caution and to proactively protect Arizona’s children, the Arizona Department of Environmental Quality (ADEQ) initiated a six-month, statewide screening program for lead in public school district drinking water. Thanks to the overwhelming support from elected officials, sister and local agencies, municipal public water providers and Arizona public school districts, and others this successful program has benefited Arizona’s children’s health and confirmed that drinking water in public school districts is not a common source of lead in Arizona.

## What We Learned

Drinking water in public school districts is not a common source of lead in Arizona.

Fixtures and piping are the source of lead for the small number of confirmed elevated levels found in drinking water.

### Overview

**16,125** samples  
from **14,782** fixtures  
in **11,585** buildings  
in **1,427** schools

**180** school districts  
with the help of  
**14** analytical labs  
and  
**6** city partners

### Sampling

ADEQ and its partners collected 16,125 samples from 14,782 fixtures at all public school district schools, taking immediate corrective actions and retesting fixtures in buildings that tested higher than the screening level.

### Results

96% of all fixtures screened were found to be protective and required no action.

## What Next?

The Arizona School Facilities Board is addressing the small number of fixtures and piping with confirmed elevated levels of lead in drinking water.

# ACKNOWLEDGEMENTS

ADEQ expresses appreciation to all of our partners for making this statewide, voluntary program a success – especially our sister state agencies that helped us develop the program and provide ongoing support. Special thanks go to elected and appointed public school district superintendents and their staff whose commitment and dedication has enabled Arizona to be the only state in the nation to complete a proactive and collaborative voluntary screening program for lead in public school districts’ drinking water in six months’ time.

## STATE AGENCY PARTNERS

## COUNTY & MUNICIPAL PARTNERS

### – ARIZONA’S COUNTY HEALTH OFFICIALS –

Staff from the Cities of Glendale, Peoria, Phoenix, Scottsdale, Tempe, Tucson

# OVERVIEW

Out of an abundance of caution and to protect Arizona’s children, the Arizona Department of Environmental Quality (ADEQ) initiated a six-month, statewide screening program for lead in public school district drinking water. The intention of this voluntary program, in response to nationwide concern stemming from Flint, Michigan, was to find out whether lead contamination is present in school drinking water and reduce exposure. ADEQ knows that regulated public water systems are not a common source of lead in Arizona drinking water. ADEQ also knows that lead can leach from fixtures, connections and piping, especially in piping systems with extended periods of non-use. Potential drinking water impacts from lead leaching from fixtures and/or pipes was unknown at schools because neither federal nor Arizona state law requires that schools test drinking water.

- Arizona is the **only state** that successfully has:
  - ✓ Completed a proactive, comprehensive, voluntary screening program for lead in public school district drinking water, and
  - ✓ Accomplished this program within six months’ time.
- Arizona also is **one of only four states** that has completed any statewide lead screening program for school drinking water.

While drinking water is not a common source of lead in Arizona, eliminating exposure to lead in drinking water is an important step in reducing a child’s overall exposure to lead in the environment.

ADEQ and its partners designed the program to best work with and support public school districts’ participation. This was accomplished by developing and providing school faculty and staff with all of the necessary tools and resources to communicate, conduct, track and provide the screening program information to their parents and students.

## ADEQ LED A MULTI-AGENCY PROGRAM TO:

- Identify and take immediate action to reduce lead exposure at drinking water fixtures of concern
- Inform short- and long-term corrective actions and solutions

## THE PROACTIVE APPROACH

(SEE APPENDIX 1 FOR PROCESS FLOW CHART):

- Screen drinking water in all Arizona public school districts for lead using a conservative screening level of 15 parts of lead per billion parts of water (15 ppb)\*  
[“Initial Screening”]
- Confirm Sampling level exceedances  
[“Confirmation Sampling”]
- Verify effectiveness of implemented corrective actions  
[“Post Corrective Action Sampling”]

Details regarding the process, timeline, costs and references for related lead rules are provided in Appendices 1 through 5.

View detailed program information, including screening tools and results, guidance, geographic results maps for schools, parents and the community, at [azdeq.gov/LeadScreeningProg](http://azdeq.gov/LeadScreeningProg).

\* ppb - 1 ppb is roughly 1 teaspoon of material in an Olympic-size swimming pool. Similar to 1 penny in \$10,000,000.

# RESULTS

The following summarizes program analytical data for Initial Screening and Confirmation Sampling (see Appendices 6 and 7 for program results by public school district and by county).

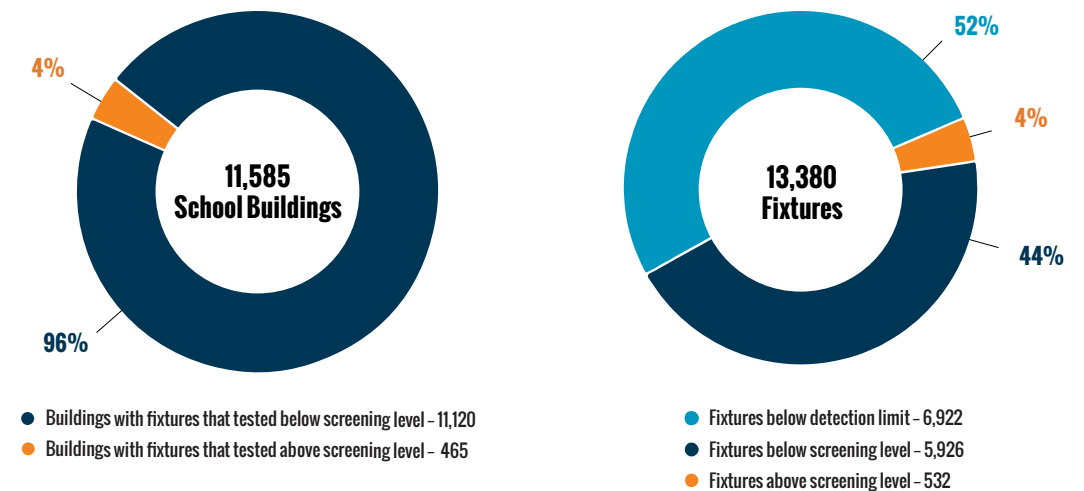

## INITIAL SCREENING:

ADEQ selected 15 ppb as the conservative program screening level to match the protectiveness of the federal drinking water standard. The U.S. Environmental Protection Agency’s (EPA’s) technical guidance document, “3Ts for Reducing Lead in Drinking Water in Schools,” specifies 20 ppb as the action level for screening lead in schools. ADEQ’s decision to use a more conservative screening level effectively reduced exposure from an additional 124 fixtures that would have been missed using EPA’s 3Ts 20 ppb level.

96 percent of the 13,380 fixtures tested during the Initial Screening from 1,427 public schools (11,585 buildings) within Arizona’s 180 public school districts tested below the conservative 15 ppb screening level and these fixtures required no further action. Of the 532 fixtures with Initial Screening results higher than the screening level, only 422 moved on to Confirmation Sampling based on information provided by school officials that these fixtures were used for drinking. The remaining fixtures did not warrant Confirmation Sampling because they were not drinking water fixtures or located in buildings that were either unoccupied, not in use or scheduled for demolition.

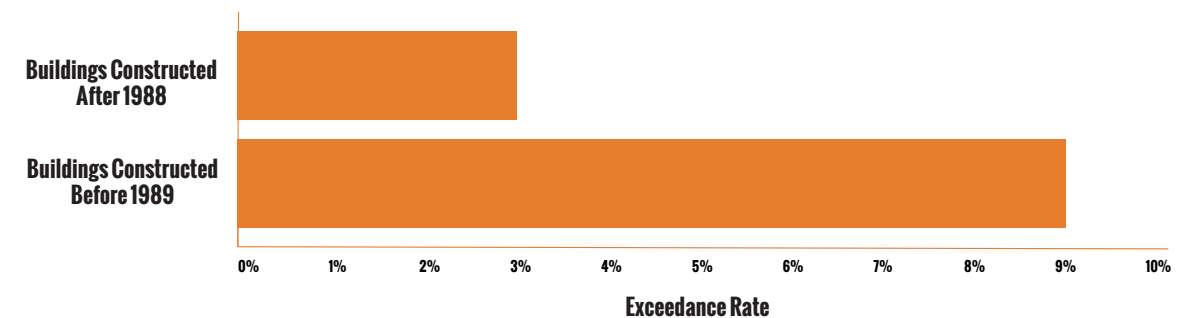

## INITIAL SCREENING OVERVIEW\*

\*Represents data from 1,427 school campuses, and include some collected from non-drinking water fixtures.

Initial Screening results also demonstrated that school buildings constructed before 1989 (older buildings) had a higher number of screening level exceedances, as expected due to more protective construction standards that came into effect in 1987.

## INITIAL SCREENING BUILDING EXCEEDANCE RATE BY AGE

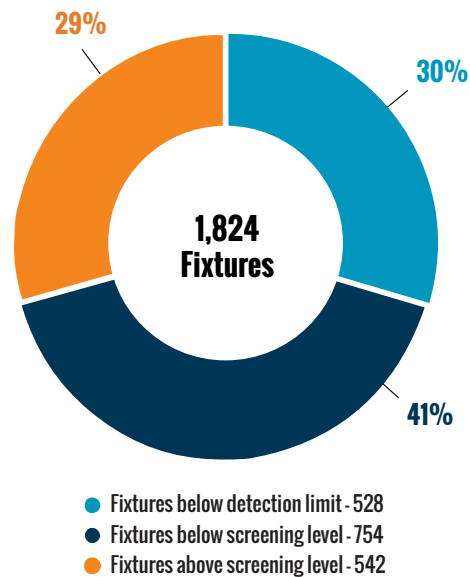

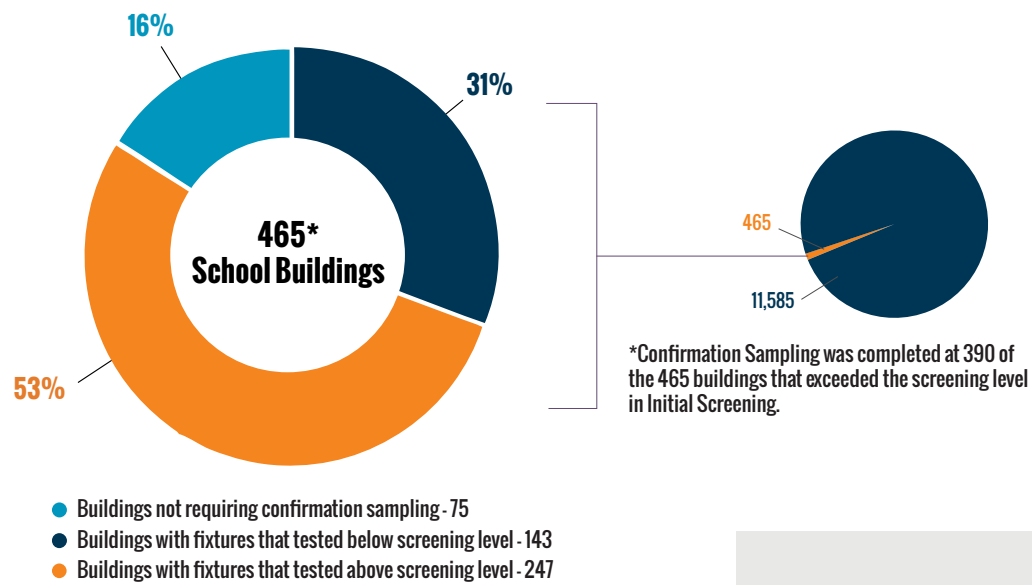

# RESULTS

## CONFIRMATION SAMPLING:

Confirmation Sampling was conducted for the 422 fixtures identified during Initial Screening. In addition, all other drinking water fixtures located in these buildings were tested, bringing the total number of fixtures tested during Confirmation Sampling to 1,824. 71 percent of the 1,824 fixtures tested during the Confirmation Sampling tested below the conservative 15 ppb screening level and these fixtures required no further action. For the 29 percent of fixtures with results that exceeded the screening level, corrective action was suggested and several options offered.

## CONFIRMATION SAMPLING OVERVIEW\*

\*Represents data from 248 school campuses, and include some collected from non-drinking water fixtures.

*“It is apparent that the state of Arizona has surveyed lead concentrations in public school drinking water using a very conservative threshold on which to take corrective action. After reviewing this report, I see no evidence that public school drinking water serves as a significant contributor to lead poisoning in Arizona’s children.”*

STEVEN CURRY, M.D.  
 Professor of Medicine  
 University of Arizona College of Medicine - Phoenix  
 Chief, Department of Medical Toxicology  
 Banner - University Medical Center Phoenix

# POST CORRECTIVE ACTION SAMPLING

The Arizona School Facilities Board is actively working with public school districts to replace fixtures with confirmed lead levels higher than the screening level to ensure students have adequate access to healthy drinking water (Please see interim, internal link to the Arizona School Facilities Board huddle presentation: <https://prezi.com/view/naNja17lbrJ1Xu26ks44/>).

ADEQ is coordinating with the schools to sample and verify that these fixture replacements solved the lead problem in drinking water. If sampling confirms no lead problem, no further action is recommended (see Appendix 2 for the Post Corrective Action Process Flow).

EPA guidance indicates lead may be found following installation of new piping and fixtures until scale builds up in the lines, creating a protective barrier. If Post Corrective Action Sampling shows lead is present, ADEQ recommends that schools continue to implement the interim actions put in place following Initial Screening (follow the daily flushing protocol or keep the drinking water fixture out of service). Additional samples from these fixtures will be collected at three and six-month intervals to verify effectiveness of the corrective action or determine whether additional action is needed.

# RECOMMENDATIONS

- Test any drinking water fixture in public school district school buildings constructed before 1989 that was not tested in this program.
- Develop a strategy to address the small number of fixtures and piping with confirmed elevated levels of lead in drinking water.
- To ensure Arizona’s children continue to receive healthy drinking water and prevent potential effects to drinking water quality, develop and implement an ongoing flushing program at school facilities to address extended periods of non-use.

# APPENDICES

PAGE INTENTIONALLY LEFT BLANK

# APPENDIX 1

## PROCESS FLOW CHART

### SAMPLING PROTOCOL:

- Collected from cold-water taps only
- Collected in the morning before staff & students arrive (water left standing in pipes a minimum of six hours)
- 250 milliliters collected from drinking water fixtures for Initial Screening
- Additional samples collected for Confirmation Sampling

# APPENDIX 2

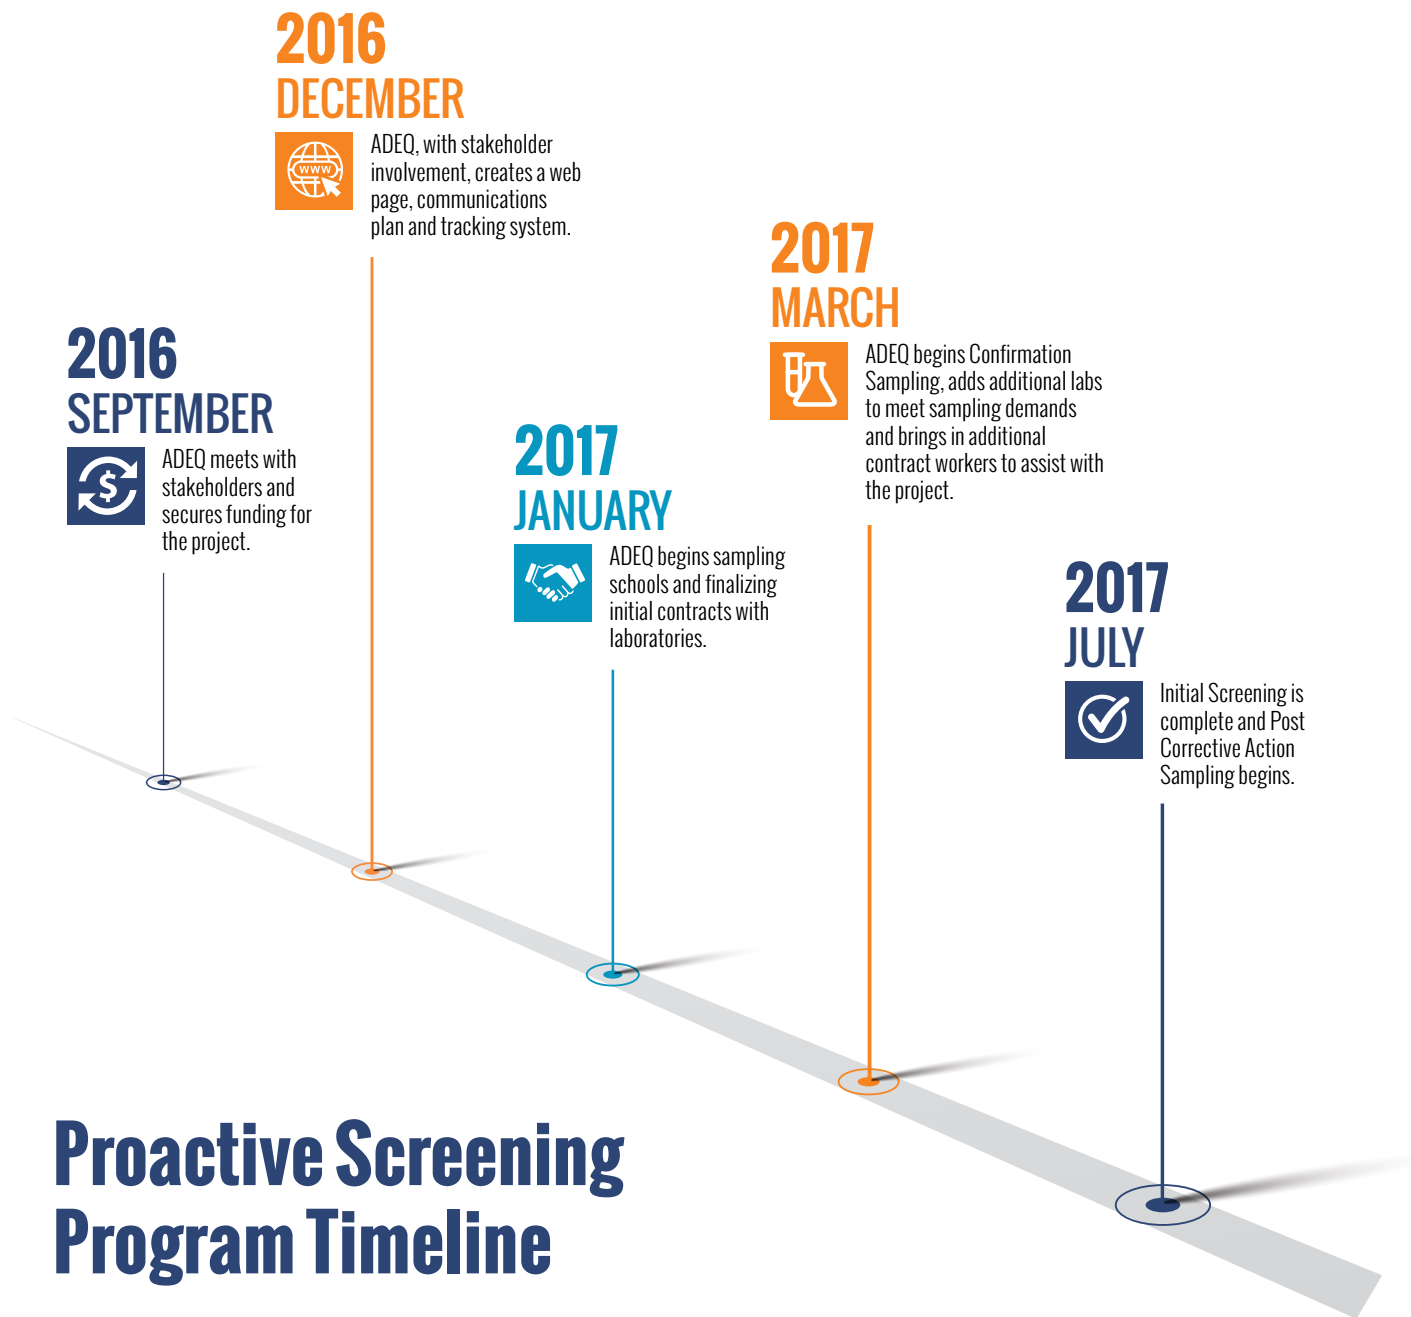

## POST CORRECTIVE ACTION PROCESS FLOW

# APPENDIX 3

## TIMELINE

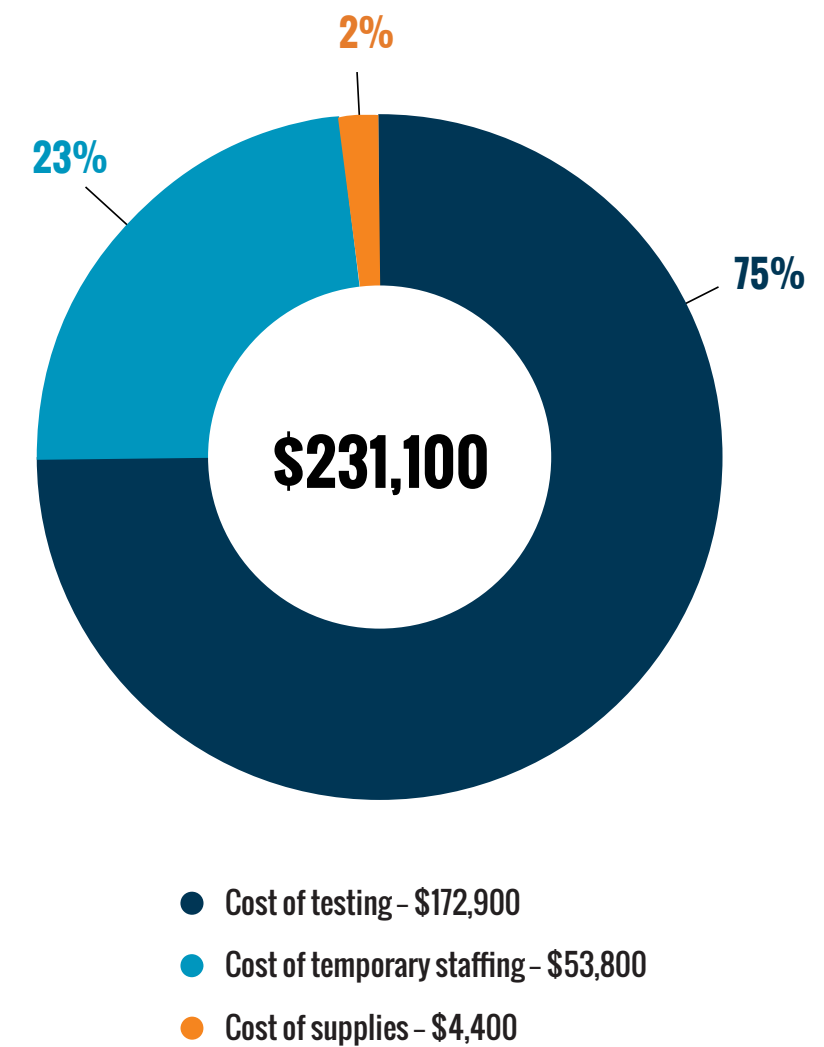

# APPENDIX 4

## COSTS

ADEQ completed the Initial Screening and the expanded project scope including Confirmation Sampling for \$231,100. This low cost was in large part due to the renegotiation of state analytical contracts, reusing boxes to assemble sampling kits and from in-kind contributions of six municipal partners. ADEQ estimates that \$70,000 of program analytical costs were provided by municipal partners. Key expenditures included shipping, sample analysis, temporary contract staff and sampling kits/assembly. In kind services provided by full-time State of Arizona staff from ADEQ, the Arizona School Facilities Board, the Arizona Department of Health Services and the Arizona Department of Education to support the program are estimated upwards of \$215,000.

### ADEQ EXPENDITURES

Initial Screening and Confirmation Sampling

The Arizona Schools Facilities Board estimates it will take \$400,000 to repair and replace fixtures identified by Confirmation Sampling that exceeded the screening level.

# APPENDIX 5

## REFERENCES FOR RELATED LEAD RULES

### SAFE DRINKING WATER ACT (SDWA) (1974):

Required EPA to establish regulations for known or potential contaminants in drinking water for the purpose of protecting public health.

### THE LEAD BAN (1986):

A requirement that only lead-free materials be used in new plumbing and in plumbing repairs. Plumbing fixtures, piping and solder without a “lead-free” designation were banned from sale after Aug. 6, 1998.

### THE LEAD CONTAMINATION CONTROL ACT (LCCA) (1988):

The LCCA further amended the SDWA. The LCCA is aimed at the identification and reduction of lead in drinking water at schools and child care facilities. However, implementation and enforcement of the LCCA has been at each state’s discretion. School monitoring and compliance has varied widely.

### THE LEAD AND COPPER RULE (1991):

A regulation by EPA to minimize the corrosivity and amount of lead and copper in water supplied by public water systems.

### THE REDUCTION IN LEAD IN DRINKING WATER ACT (2011):

This act took effect on Jan. 4, 2014. All water systems that provide water for human consumption must use material that meet the updated “lead-free” requirement. The new standard lowered the allowable lead content of wetted surfaces from 8.0 percent to a weighted average of 0.25 percent.
