1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. The smelter air emissions are released to the atmosphere through a 1,000-foot (approximately 300 meter) tall stack. To help refine future AERMOD air dispersion modeling at the facility, ASARCO has been performing site-specific meteorological monitoring at Hayden. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

ASARCO supplemented the 10 meter meteorological tower with a Remtech PA-0 phased-array acoustic Sodar in late May 2014 that measures winds at elevations ranging from approximately 50 to 400 meters above ground level. Sodar (SOnic Detection And Ranging) systems are used to remotely measure the vertical turbulence structure and the wind profile of the lower layer of the atmosphere. Sodar systems are like radar systems except that sound waves rather than radio waves are used. A profile of the atmosphere as a function of height can be obtained by analyzing the return signal at a series of times following the transmission of each pulse. Three antenna beams oriented along the U, V, and W directions allow the calculation of horizontal and vertical wind speeds and directions. Phased-array Sodar systems use a single array of speaker drivers and horns (transducers), and the three antenna beams are electronically generated and steered by phasing the transducers appropriately.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the sodar and 10-meter tower data validation report for the period December 2015 through February 2016. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses instrument calibration and audit results, data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the data screening results. Appendix B presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

The tower and sodar data was remotely collected and reviewed on a daily basis. The sodar data was also regularly compared to the tower wind data to ensure proper sodar operation. No significant operational events occurred during the period.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

A calibration of the ST-10 meteorological equipment was performed on December 18, 2015, and the calibration results are presented in Appendix A. The calibrations demonstrate that the meteorological systems were operating within the acceptable DQO ranges, as listed in the project's QAPP Table B-1. The QAPP does not list calibration DQOs for the parameters collected at ST-10 that are not used in AERMOD dispersion modeling, those parameters being pressure, precipitation, and relative humidity. The DQOs that were used to validate these three additional parameters are listed in Tables 0-7 and 0-8 in EPA's *Quality Assurance Handbook for Air Pollution Measurement Systems - Volume IV: Meteorological Measurements Version 2.0* (March 2008), which list PSD measurement DQOs.

A quality assurance performance audit was also conducted on the ST-10 meteorological tower equipment on December 18, 2015, before any tower calibrations or adjustments were made. This audit was performed by independent personnel, using independent certified audit standards. The results from this audit are also presented in Appendix A, and indicate that the meteorological systems were operating within the acceptable DQO ranges.

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.

- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.
- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses. Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). Additional data screening is also performed on the sodar data. The internal sodar diagnostic data, including signal to noise ratios (SNRs), the FEMAX ground clutter number, the JAM internal electronic test diagnostic value, and the number of spurious signals (SPU) are screened against manufacturer recommended values. Time series data from the Sodar are screened against rates of change and persistence criteria, and the vertical profiles of the Sodar are screened against expected rate of change with altitude criteria. If the comparisons fall outside of typical ranges, the record is flagged for further inspection. The 15-minute Sodar data are averaged into hourly data using unit vector wind direction averages and scalar wind speed averages, in accordance with Section 6.2 of EPA's Met Monitoring Guidance.

Table 1 summarizes the data screening and validation criteria used for both the 10 meter meteorological tower parameters and the sodar.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were 0.0, -1.7, and -4.1 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%
Sodar Internal Diagnostic Data	JAM > 0, FEMAX > 600, SNR % total bandwidth > 5, SPU > 7.
Sodar Time Series Rate of Change	Same range and persistence checks as listed above for wind speed and direction.
Sodar Rate of Change for Altitude Gates	WS difference more than 4.5 m/s between altitude gates, and WD difference more than 120 degrees between altitude gates.
Sodar Comparison to 10-meter Wind Data	When Wind Speed is > 2 m/s and time is between 10am and 5 pm, then: Wind Speed Average Bias < 1 m/s, WD Standard Deviation Variability < 2 m/s, Wind Direction Average Bias < 10 degrees, WD Standard Deviation Variability < 30 degrees

Appendix A presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix A presents comments from the manual review, including any necessary data edits. The data review resulted in the invalidation of 8 hours of sodar data, for the hours of 12/3/2015 15:00, 12/12/2015 23:00, 12/20/2015 15:00, 1/2/2016 17:00, 1/22/2016 10:00, 1/26/2016 4:00, 2/23/2016 16:00, and 2/23/2016 20:00.

Quality control comparisons of the hourly average 100 meter sodar wind speed and direction data to the hourly average 10 meter meteorological measurements are also performed for the quarter. These tests are performed only when the atmosphere is well mixed and the 10 meter surface winds should be coupled to the Sodar height winds, which occurs during daytime periods (between 10 am and 5 pm) with moderate wind speeds (greater than 2 m/s). The average difference and standard deviation of differences for wind speed and wind direction were computed and compared to the same DQOs EPA recommends for sodar audits against nearby

meteorological towers (even though for an audit, the sodar and tower measurement heights are at the same height, and therefore should agree better than 10 meter tower and 100 meter sodar data). Table 2 presents the results of this quality control comparison for the quarter, and demonstrates that the sodar agrees with the 10-meter tower within the EPA recommended DQO criteria.

Table 2 – Sodar QC Comparisons to 10m Tower Wind Data

Parameter	EPA DQOs	Dec 2015 to February 2016 Performance
Wind Speed Average Difference (m/s)	$< \pm 1$	0.46
Wind Speed Std Dev Difference (m/s)	< 2	0.95
Wind Direction Average Difference (degrees)	$< \pm 10$	-2.7
Wind Direction Std Dev Difference (degrees)	< 30	22.6

Note: The 100m level of hourly averaged sodar wind data was compared to 10m tower wind data.

3.3 Data Capture Statistics

Based on the review of data from calibrations, audits, and the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 3 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis, and the quarterly data capture rates are well above 90% for each month for all parameters except the 400 m level sodar winds and the sigma W data. This is not unexpected, as sodars have difficulty collecting data at altitudes greater than approximately 300 meters, especially in hot and dry locations such as the ST-10 site. EPA also notes in Section 9.8 of the Met Monitoring Guidance that "data capture for wind direction and wind speed from a sodar is defined somewhat differently than for more conventional instruments", and "an averaging period (e.g., hourly) is considered valid if there are at least three valid levels of data for the period (independent of height)". The data capture rates for all sodar levels equal to and below 300 meters in height all meet the data completeness DQO, and therefore the sodar data capture rates meet EPA requirements.

In summary, all meteorological data collected during the quarter meets the DQO completeness goal for all parameters.

Table 3 - Data Capture Statistics

4.0 DATA RESULTS

Appendix B presents plots of various monthly data summaries and data tables for the reporting period (these tables include sodar data for the 100, 300, and 400 meter levels). Also submitted with this report are 15-minute and hourly data files in a format designed for AERMET data processing (all sodar altitude levels are included in these data files).

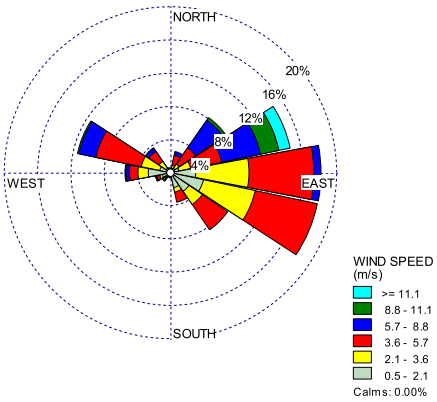

Figure 1 presents plots of the quarterly wind speed and wind direction data at selected heights of 10, 100, and 300 meters above ground, in a format called a "wind rose" plot. These wind roses indicated that there are two predominate wind directions at the site; one from the east (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours). As expected, the wind speeds at 100 and 300 meter levels are higher than the 10 meter winds, with fewer hourly observations in the lower wind speed ranges (gray and yellow bars in the wind roses).

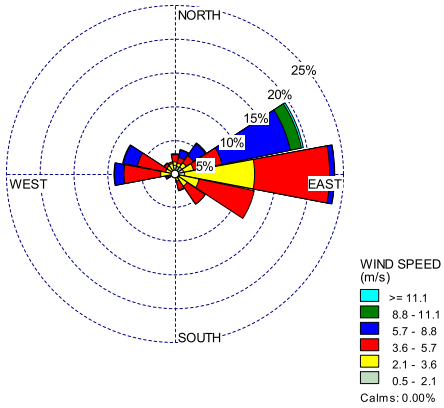
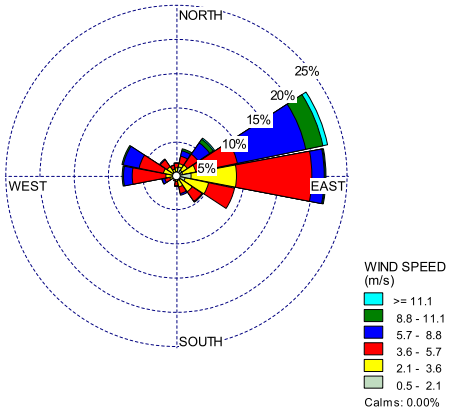
The review of the wind data indicates that there is a diurnal flow pattern at the site, with winds frequently from the east and southeast directions in the morning and evening hours with light to moderate speeds, followed by afternoons with moderate to strong winds. This pattern is evident in the wind roses, and can also be seen in an example of the daily wind data profiles shown in Figure 2 with light easterly and southeasterly flows in the morning followed by stronger westerly wind flows during the afternoon hours. This pattern repeats itself for the majority of the days, and results in the observed bi-modal wind rose distributions.



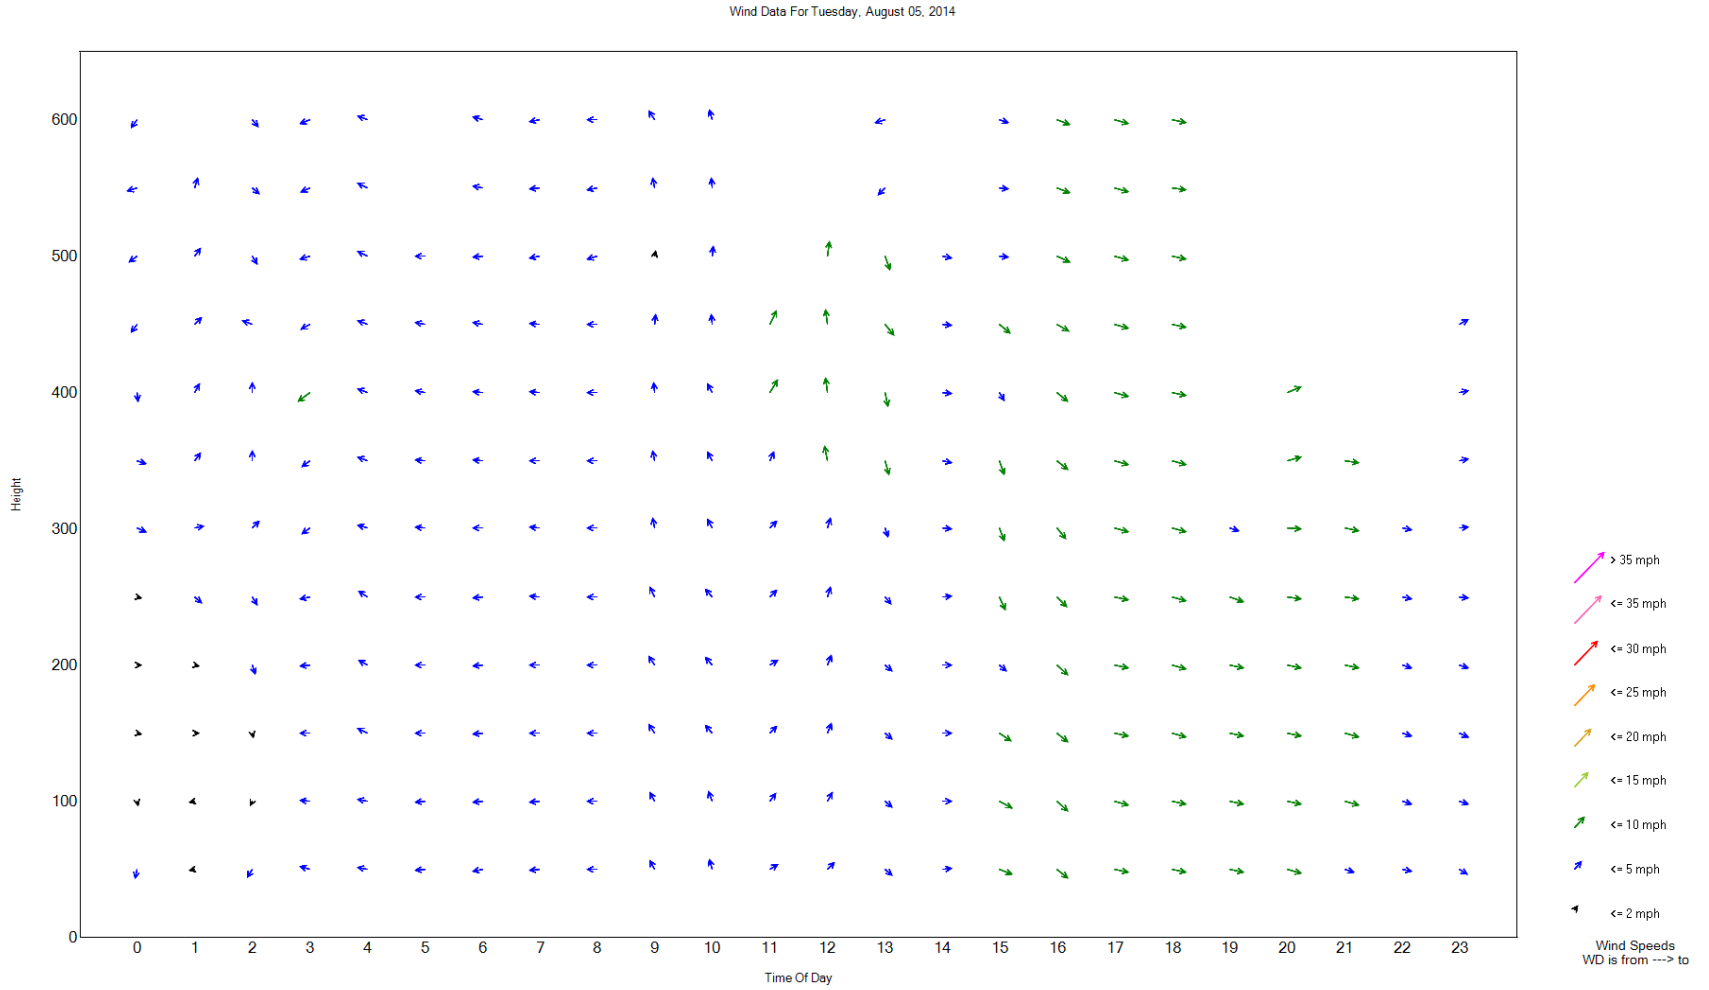
The three-month digital data base in an ASCII format suitable for AERMET processing is included with this data report. It is recommended that Sodar data only up to 400m be used for AERMET processing, for the following reasons. First, this altitude extends 100m taller than the main stack height, which will allow AERMOD to properly simulate stack tip downwash, plume rise, and plume transport. Second, the data capture rates at altitudes above 400m are lower than at altitudes below 400m, and there is an increased number of data screening flags (which indicates that data from higher elevations may not be as reliable as data from 400m and lower altitudes). Therefore, it is not likely that data from these higher Sodar altitudes would add to the accuracy of the AERMET data profile. The included AERMET Stage 1 input file for the onsite data is setup to only process Sodar data up to 400m altitude.

Figure 1 –Wind Rose Plots



10-Meter Wind Rose

100-Meter Wind Rose



300-Meter Wind Rose

Wind directions are the direction the wind is blowing FROM.

Figure 2 – Example of Typical Diurnal Wind Flow Patterns

Note: Arrows are wind flow vectors and point to the direction the wind is blowing to.

SOLAR RADIATION SENSOR

Standard (kw/m2)	Logger (kw/m2)	Difference (kw/m2)	Difference (% of FS)
0.59	0.57	-0.02	-1%

Full Scale is 2.0 kw/m2, acceptable tolerance is 5 %

(Note - sensor mV readings are converted to kw/m2 by multiplying 0.1025)

Comments:

Audit starts 09:15, is over 12:00

Sodar alignment at 300 mag along left side of enclosure, so true alignment is 310.

This is converted to system azimuth by subtracting 180 degrees.

Therefore, Audit alignment is 130 and Sodar system is at 133.

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. The smelter air emissions are released to the atmosphere through a 1,000-foot (approximately 300 meter) tall stack. To help refine future AERMOD air dispersion modeling at the facility, ASARCO has been performing site-specific meteorological monitoring at Hayden. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

ASARCO supplemented the 10 meter meteorological tower with a Remtech PA-0 phased-array acoustic Sodar in late May 2014 that measures winds at elevations ranging from approximately 50 to 400 meters above ground level. Sodar (SOnic Detection And Ranging) systems are used to remotely measure the vertical turbulence structure and the wind profile of the lower layer of the atmosphere. Sodar systems are like radar systems except that sound waves rather than radio waves are used. A profile of the atmosphere as a function of height can be obtained by analyzing the return signal at a series of times following the transmission of each pulse. Three antenna beams oriented along the U, V, and W directions allow the calculation of horizontal and vertical wind speeds and directions. Phased-array Sodar systems use a single array of speaker drivers and horns (transducers), and the three antenna beams are electronically generated and steered by phasing the transducers appropriately.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the sodar and 10-meter tower data validation report for the period March through June 2016. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses instrument calibration and audit results, data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the data screening results. Appendix B presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

The tower and sodar data was remotely collected and reviewed on a daily basis. The sodar data was also regularly compared to the tower wind data to ensure proper sodar operation. No significant operational events occurred during the period.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

A calibration of the ST-10 meteorological equipment was performed on May 26, 2016, and the calibration results are presented in Appendix A. The calibrations demonstrate that the meteorological systems were operating within the acceptable DQO ranges, as listed in the project's QAPP Table B-1. The QAPP does not list calibration DQOs for the parameters collected at ST-10 that are not used in AERMOD dispersion modeling, those parameters being pressure, precipitation, and relative humidity. The DQOs that were used to validate these three additional parameters are listed in Tables 0-7 and 0-8 in EPA's *Quality Assurance Handbook for Air Pollution Measurement Systems - Volume IV: Meteorological Measurements Version 2.0* (March 2008), which list PSD measurement DQOs.

A quality assurance performance audit was also conducted on the ST-10 meteorological tower and sodar equipment on May 26, 2016, before any tower calibrations or adjustments were made. This audit was performed by independent personnel, using independent certified audit standards. The results from this audit are also presented in Appendix A, and indicate that the meteorological systems were operating within the acceptable DQO ranges.

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.

- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.
- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses. Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). Additional data screening is also performed on the sodar data. The internal sodar diagnostic data, including signal to noise ratios (SNRs), the FEMAX ground clutter number, the JAM internal electronic test diagnostic value, and the number of spurious signals (SPU) are screened against manufacturer recommended values. Time series data from the Sodar are screened against rates of change and persistence criteria, and the vertical profiles of the Sodar are screened against expected rate of change with altitude criteria. If the comparisons fall outside of typical ranges, the record is flagged for further inspection. The 15-minute Sodar data are averaged into hourly data using unit vector wind direction averages and scalar wind speed averages, in accordance with Section 6.2 of EPA's Met Monitoring Guidance.

Table 1 summarizes the data screening and validation criteria used for both the 10 meter meteorological tower parameters and the sodar.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were 0.0, -1.8, and -4.1 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%
Sodar Internal Diagnostic Data	JAM > 0, FEMAX > 600, SNR % total bandwidth > 5, SPU > 7.
Sodar Time Series Rate of Change	Same range and persistence checks as listed above for wind speed and direction.
Sodar Rate of Change for Altitude Gates	WS difference more than 4.5 m/s between altitude gates, and WD difference more than 120 degrees between altitude gates.
Sodar Comparison to 10-meter Wind Data	When Wind Speed is > 2 m/s and time is between 10am and 5 pm, then: Wind Speed Average Bias < 1 m/s, WD Standard Deviation Variability < 2 m/s, Wind Direction Average Bias < 10 degrees, WD Standard Deviation Variability < 30 degrees

Appendix A presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix A presents comments from the manual review, including any necessary data edits. The data review resulted in the manual invalidation of 20 hours of sodar data.

Quality control comparisons of the hourly average 100 meter sodar wind speed and direction data to the hourly average 10 meter meteorological measurements are also performed for the quarter. These tests are performed only when the atmosphere is well mixed and the 10 meter surface winds should be coupled to the Sodar height winds, which occurs during daytime periods (between 10 am and 5 pm) with moderate wind speeds (greater than 2 m/s). The average difference and standard deviation of differences for wind speed and wind direction were computed and compared to the same DQOs EPA recommends for sodar audits against nearby meteorological towers (even though for an audit, the sodar and tower measurement heights are at

the same height, and therefore should agree better than 10 meter tower and 100 meter sodar data). Table 2 presents the results of this quality control comparison for the quarter, and demonstrates that the sodar agrees with the 10-meter tower within the EPA recommended DQO criteria.

Table 2 – Sodar QC Comparisons to 10m Tower Wind Data

Parameter	EPA DQOs	March to June 2016 Performance
Wind Speed Average Difference (m/s)	$< \pm 1$	0.7
Wind Speed Std Dev Difference (m/s)	< 2	1.1
Wind Direction Average Difference (degrees)	$< \pm 10$	-3.5
Wind Direction Std Dev Difference (degrees)	< 30	24.2

Note: The 100m level of hourly averaged sodar wind data was compared to 10m tower wind data.

3.3 Data Capture Statistics

Based on the review of data from calibrations, audits, and the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 3 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis, and the quarterly data capture rates are well above 90% for each month for all parameters except the 400 m level sodar winds and the sigma W data. This is not unexpected, as sodars have difficulty collecting data at altitudes greater than approximately 300 meters, especially in hot and dry locations such as the ST-10 site. EPA also notes in Section 9.8 of the Met Monitoring Guidance that "data capture for wind direction and wind speed from a sodar is defined somewhat differently than for more conventional instruments", and "an averaging period (e.g., hourly) is considered valid if there are at least three valid levels of data for the period (independent of height)". The data capture rates for all sodar levels equal to and below 300 meters in height all meet the data completeness DQO, and therefore the sodar data capture rates meet EPA requirements.

In summary, all meteorological data collected during the quarter meets the DQO completeness goal for all parameters.

Table 3 - Data Capture Statistics

Note: The reported valid data capture rates are the percentage of the possible hours for each month, quarter, and total period.

4.0 DATA RESULTS

Appendix B presents plots of various monthly data summaries and data tables for the reporting period (these tables include sodar data for the 100, 300, and 400 meter levels). Also submitted with this report are 15-minute and hourly data files in a format designed for AERMET data processing (all sodar altitude levels are included in these data files).

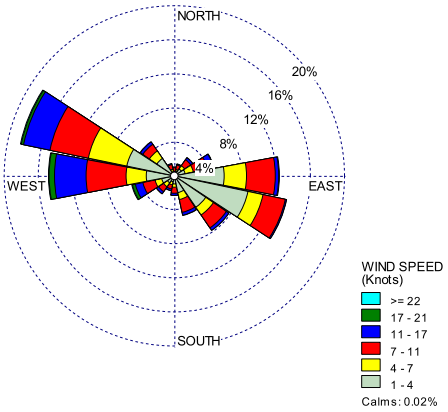

Figure 1 presents plots of the quarterly wind speed and wind direction data at selected heights of 10, 100, and 300 meters above ground, in a format called a "wind rose" plot. These wind roses indicated that there are two predominate wind directions at the site; one from the east (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours). As expected, the wind speeds at 100 and 300 meter levels are higher than the 10 meter winds, with fewer hourly observations in the lower wind speed ranges (gray and yellow bars in the wind roses).

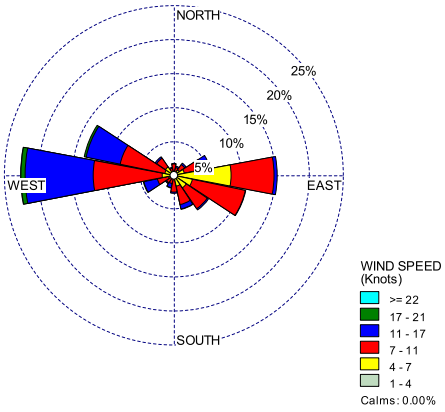
The review of the wind data indicates that there is a diurnal flow pattern at the site, with winds frequently from the east and southeast directions in the morning and evening hours with light to moderate speeds, followed by afternoons with moderate to strong winds. This pattern is evident in the wind roses, and can also be seen in an example of the daily wind data profiles shown in Figure 2 with light easterly and southeasterly flows in the morning followed by stronger westerly wind flows during the afternoon hours. This pattern repeats itself for the majority of the days, and results in the observed bi-modal wind rose distributions.



The three-month digital data base in an ASCII format suitable for AERMET processing is included with this data report. It is recommended that Sodar data only up to 400m be used for AERMET processing, for the following reasons. First, this altitude extends 100m taller than the main stack height, which will allow AERMOD to properly simulate stack tip downwash, plume rise, and plume transport. Second, the data capture rates at altitudes above 400m are lower than at altitudes below 400m, and there is an increased number of data screening flags (which indicates that data from higher elevations may not be as reliable as data from 400m and lower altitudes). Therefore, it is not likely that data from these higher Sodar altitudes would add to the accuracy of the AERMET data profile. The included AERMET Stage 1 input file for the onsite data is setup to only process Sodar data up to 400m altitude.

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. The smelter air emissions are released to the atmosphere through a 1,000-foot (approximately 300 meter) tall stack.

To help refine future AERMOD air dispersion modeling at the facility, ASARCO has been performing site-specific meteorological monitoring at Hayden. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters (10 meter wind speed, direction, and sigma theta, 2 and 10 meter temperature and delta temperature, and solar radiation).

ASARCO supplemented the 10 meter meteorological tower by installing an Remtech PA-0 phased-array acoustic Sodar in June 2014 that measures winds at elevations ranging from approximately 50 to 400 meters above ground level. Sodar (SOnic Detection And Ranging) systems are used to remotely measure the vertical turbulence structure and the wind profile of the lower layer of the atmosphere. Sodar systems are like radar systems except that sound waves rather than radio waves are used. Sodar systems operate by issuing an acoustic pulse and then receiving the return signal for a short period of time. Both the intensity and the Doppler (frequency) shift of the return signal are analyzed to determine the wind speed, wind direction and turbulence of the atmosphere. A profile of the atmosphere as a function of height can be obtained by analyzing the return signal at a series of times following the transmission of each pulse. Three antenna beams oriented along the U, V, and W directions allow the calculation of horizontal and vertical wind speeds and directions. Phased-array Sodar systems use a single array of speaker drivers and horns (transducers), and the three antenna beams are electronically generated and steered by phasing the transducers appropriately.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as EPA's Met Monitoring Guidance). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, Data Quality Objectives (DQOs), and auditing procedures.

In May, 2016, an independent quality assurance performance audit was performed on the meteorological monitoring system. This document is the audit report. Section 2 of this report describes the performance audit procedures. Section 3 presents the audit results and compares them to the Data Quality Objectives (DQOs) listed in EPA's Met Monitoring Guidance and the Project QAPP. Appendix A presents the standard certification data sheets.

2.0 AUDIT PROCEDURES

2.1 10-Meter Meteorological Tower Audit Procedures

The 10-meter meteorological tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor. The sensors are connected to a Campbell Scientific CR-1000 data logger that scans the sensors once per second and computes and store 15-minute and hourly averages.

Quality assurance performance audits evaluate the accuracy of these tower-based meteorological sensors using equipment and personnel that are independent from those used for normal operations. Audit equipment is traceable to National Institute of Standards and Technology (NIST) and manufacturer's standards, as appropriate. The accuracy DQOs used to define an acceptable audit are listed in Table 1.

Table 1 – 10-m Meteorological Tower QA Audit DQOs

Parameter	Specifications	QAPP DQO Requirements
Wind Speed (10 meters above ground level)	Starting Torque Threshold (corresponding to sensor starting threshold of 0.5 m/s)	≤ 1 gr/cm
	Sensor Accuracy	0.2 m/s
Wind Direction (10 meters above ground level)	Starting Torque Threshold (corresponding to sensor starting threshold of 0.5 m/s)	≤ 11 gr/cm
	Sensor Accuracy	5 degrees
Temperature (at 2 and 10 meters above ground level)	Sensor Accuracy	0.5 C
Temperature Difference	Sensor Accuracy	0.1 C
Solar Radiation	Sensor Accuracy	5%

Audit procedures for meteorological sensors are presented in the Project QAPP, and are summarized below.

Wind Direction Audit Procedure

The wind sensor orientation is determined using a professional magnetic compass and the RM Young siting fixture. True north is distinguished from magnetic north by reading a magnetic compass and applying a correction factor for the magnetic declination. The declination has been determined from the USGS declination calculation program, and is 10 degrees easterly. The wind direction linearity is checked against various target directions using the RM Young Vane Angle Fixture. The sensor starting threshold is tested using a RM Young model 18331 torque gauge, and must be equal to or less than 11 gr/cm (equivalent to a wind speed threshold of 0.5 m/sec).

Wind Speed Audit Procedure

The horizontal wind speed calibration check is performed using a RM Young digital tachometer. Sensor readings are compared to the calibration values provided in the sensor manufacturer's specifications. The sensor starting threshold is tested using a RM Young model 18130 torque wheel, and must be equal to or less than 1.0 gr/cm (equivalent to a wind speed threshold of 0.5 m/sec).

Temperature and Delta Temperature Audit Procedure

The 2-meter and 10-meter temperature sensor calibration is verified by direct comparison of sensor outputs to a collocated standard thermometer at three different temperatures, encompassing the measurement range expected at this site. Sensors at the 2 and 10 meter levels are checked simultaneously in the same medium so that the delta temperature function can be verified.

Solar Radiation Audit Procedure

The solar radiation pyranometer output is audited using a collocated independent standard.

2.2 Sodar Audit Procedures

The Sodar performance audit compares Sodar measurements with an independent measurement technique, as recommended in Section 9.6 of EPA's Met Monitoring Guidelines. Sodar monitoring systems provide a remote, "indirect" measurement of wind and turbulence parameters. This presents a unique challenge to the quality assurance of these systems, since there is no direct counterpart to the bench top audit methodology of a wind vane. Therefore, a comparison between the Sodar and another measurement system is performed to establish the reasonableness of the Sodar data. One of EPA's recommended approaches to auditing a Sodar is a tethersonde intercomparison. A tethersonde system uses a tethered balloon to lift a

measurement package or "sonde" to an altitude corresponding with the Sodar measurements. This method then collects data over a minimum of five Sodar 15-minute averaging periods. The sonde readings are processed into U and V components that correspond to the Sodar beam directions, and are time averaged to correspond to the Sodar averaging period. The comparison of tethersonde versus Sodar data provides an overall evaluation of the Sodar performance.

A tethersonde system was used as the independent auditing standard for the ASARCO audit. The helium-filled, blimp-shaped, tethered kite/balloon system is capable of measuring wind speed, wind direction, and barometric pressure (which is used to determine height above ground). The nominal accuracy for wind speed is 5% (the sonde package uses the Renewable NRG Systems #40C Anemometer, with a stated accuracy of less than 2% uncertainty), and for wind direction is 2 degrees. The meteorological data measured by the tethersonde are scanned and stored on an SD card once every 10 seconds. The 10-second tethersonde values were then processed into 15-minute averages and compared with the 15-minute averages for the same time periods reported by the Sodar system.

The systematic difference (bias) and comparability (root-mean-square error) between the Sodar and tethersonde U and V components will be calculated using equations 9-1 and 9-2 from page 9-16 of EPA's MMGRMA guidance. Table 9-4 in the MMGRMA guidelines suggests Sodar DQO audit goals for the systematic difference and comparability, as listed below. EPA recommends that the DQO for the wind speed and wind direction comparisons should be applied when winds are greater than approximately 2 m/s (this is because when the winds are light there will be more variability in the observed speeds and directions and potentially larger differences between the Sodar and the tethersonde).

Table 2 – Sodar Performance Audit DQOs

Systematic Difference (Bias)	Comparability (RMS Error)
U and V component $< \pm 1$ m/s	U and V component $< \pm 2$ m/s
Wind Speed $< \pm 1$ m/s	Wind Speed $< \pm 2$ m/s
Wind Direction $< \pm 10$ Degrees	Wind Direction $< \pm 30$ Degrees

EPA notes that comparison results in excess of the audit goals do not necessarily mean that the data are invalid. Other reasons that can contribute to comparison results in excess of the audit goals may include unusual meteorological conditions (such as very turbulent conditions) or differences due to the locations of the two instruments. Both the reasons for and the magnitude of the measured differences should be considered in determining whether the Sodar data is valid.

In addition to the tethersonde audit, the orientation of the Sodar antenna relative to true north is measured by a compass, adjusted to compensate for the local magnetic declination. The antenna alignment is compared to the Sodar AZIMUT setting. A bubble level is used to check the antenna's level.

3.0 AUDIT RESULTS AND ANALYSIS

3.1 10-Meter Meteorological Tower Audit Results

The independent quality assurance performance audit was conducted on the meteorological tower on May 26, 2016. Table 3 presents the results for the audit, and all test results are within the Project DQOs and result in an acceptable audit.

3.2 Sodar Audit Results

The independent quality assurance performance audit of the Sodar system was conducted on May 26, 2016. EPA's Met Monitoring Guidelines recommends that data from a minimum of five Sodar averaging intervals be collected and compared, and the ASARCO audit consisted of five Sodar averaging intervals.

The tethersonde base station was located approximately 350 meters to the southeast of the Sodar antenna. The tethersonde was flown to an approximate altitude of 65 meters above ground level, during a time with elevated afternoon wind speeds and turbulence. The tethersonde clock was synchronized to the Sodar clock, and data was collected and averaged over 15 minute periods. The tethersonde altitudes were determined using the sonde measurements of barometric pressure.

Table 4 presents the results for the Sodar tethersonde audit. All test results are within the Project DQOs and result in an acceptable audit.

The orientation of the Sodar antenna, relative to true north, was measured by a compass and determined to be 120 degrees magnetic, equal to 130 degrees true. This was compared to the Sodar AZIMUT setting of 133 degrees, and the audit readings were within 3 degrees of the Sodar orientation. A bubble level was also used to confirm the antenna was level.

IMPEDANCE	29 Ω
TEMPERATURE	22 ± 2 °C
REFERENCE PYRANOMETER	Kipp & Zonen CMP 21 sn 100418 active from 01 January 2015
CALIBRATION DATE	26 October 2015
CLASSIFICATION	ISO 9060, Secondary Standard

Calibration procedure

The indoor calibration procedure is based on a side-by-side comparison with a reference pyranometer under an artificial sun fed by an AC voltage stabiliser. It embodies a 150 W Metal-Halide high-pressure gas discharge lamp. Behind the lamp is a reflector with a diameter of 16.2 cm. The reflector is above the pyranometers producing a vertical beam. The reference and test pyrano-meters are mounted horizontally on a table, which can rotate. The irradiance at the pyranometers is approximately 500 W/m². During the calibration procedure the reference and test pyranometer are interchanged to correct for any non-homogeneity of the beam. This procedure is in accordance with ISO 9847, Type IIc.

Hierarchy of traceability

The reference pyranometer was compared with the sun and sky radiation as source under mainly clear sky conditions using the "continuous sun-and-shade method". The measurements were performed in Davos (latitude: 46.8143°, longitude: -9.8458°, altitude: 1588 m above sea level). The readings are referred to the World Radiometric Reference (WRR) as stated in the WMO Technical Regulations. The originally estimated uncertainty of the WRR relative to SI is ±0.3%.

The inclination of the receiver surface versus the true horizontal plane was set to 0.0 degrees, the instrument signal wire to the north. During the comparisons, the instrument received global radiation intensities from 665 to 1082 with a mean of 897 W/m². The angle between the solar beam and the normal of the receiver surface varied from 25.3 to 50.0 with a mean of 33.7 degrees. The ambient temperature ranged from +15.3 to +25.3 with a mean of +20.7 °C. The sensitivity calculation and the single measurements deviation (σ) are based on 626 individual measurements. The obtained sensitivity value and its expanded uncertainty (95% level of confidence) are valid for similar conditions and are: 9.80 ± 0.12 µV/W/m² (but is corrected for its directional response by Kipp & Zonen to 9.80 µV/W/m²).
Dates of measurements: 15-19, 25 July 2014

Global radiation data were calculated from the direct solar radiation as measured with the absolute cavity pyrheliometer PMO2 (member of the WSG, WRR-Factor: 0.998623, based on the last International Pyrheliometer Comparison IPC-2010) and from the diffuse radiation as measured with a continuous disk shaded pyranometer Kipp & Zonen CM22 SN 020059 with sensitivity 8.88 (ventilated with heated air, instrument wire to the north).

Justification of total instrument calibration uncertainty

The combined uncertainty of the result of the calibration is the positive "root sum square" of two uncertainties.
1. The expanded uncertainty due to random effects and instrumental errors during the calibration of the reference CMP 21 as given by the World Radiation Center in Davos is ±0.12/9.80 = ±1.22%. (See traceability text).
2. Also based on experience the expanded uncertainty of the transfer procedure (calibration by comparison) is estimated to be ±0.5%.
The estimated combined expanded uncertainty is the positive "root sum square" of these two uncertainties: $\sqrt{(1.22^2 + 0.5^2)} = \pm 1.32\%$.

Notice

The calibration certificate supplied with the instrument is at the date of first use. Even though the calibration certificate is dated relative to manufacture, or recalibration, the instrument does not undergo any sensitivity changes when kept in the original packing. From the moment the instrument is taken from its packaging and exposed to irradiance the sensitivity may deviate with time. See the 'non-stability' value (% change in sensitivity per year) given in the radiometer specifications.

Delft, The Netherlands, 26 October 2015

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the 10-meter tower data validation report for the period July through September 2016. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses instrument calibration and audit results, data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the data screening results. Appendix B presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

The tower data was remotely collected and reviewed on a regular basis. The following significant operational events occurred during the period.

An apparent lightning strike occurred at the tower on July 20, 2016, at about 4pm, and the data logger and communication system became inoperative. A site technician inspected the site on July 22 and noted that the main AC power was down. On July 26 the AC power system was repaired and the data logger and communication modem were rebooted and began operation. The status of the sensors at that time included operational wind and precipitation sensors, and an inoperative solar radiation sensor. While the barometric pressure and relative humidity initially appeared to be operating properly, they subsequently exhibited erratic readings. The solar radiation sensor was replaced with a spare on July 29, 2016.

There continued to be periods in early August with erratic readings for the solar radiation, barometric pressure, and relative humidity sensors. It is possible that damage to the data logger, and/or periodic losses of AC power combined with a damaged battery caused these erratic readings as the sensors are directly powered by the 12 volt output on the data logger. To address this, the data logger and battery were replaced on August 30, 2016. In addition, the solar radiation sensor was replaced with a new sensor on September 13, and the relative humidity sensor was replaced on September 19, 2016. All equipment operated properly after these repairs were completed.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

Calibrations and audits were performed the previous quarter in May 2016, and were scheduled for the next quarter in November 2016 (the November calibrations confirmed that the as-found accuracy of all the repaired sensors was within the DQOs).

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.
- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.
- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses. Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). If the comparisons fall outside of typical ranges, the record is flagged for further inspection. Table 1 summarizes the data screening and validation criteria used for the 10 meter meteorological tower parameters.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were 0.0, -3.7, and -5.3 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%

Appendix A presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix A presents comments from the manual review, including any necessary data edits.

3.3 Data Capture Statistics

Based on the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 2 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis. The wind speed, direction, temperature, delta temperature, and precipitation parameters met the quarterly data capture goals. The lightning strike and related issues with the solar radiation, barometric pressure, and relative humidity sensors described in Section 2 resulted in the quarterly data capture for those parameters being less than the 90% goal. However, since the equipment repairs have been completed, the data capture rate for these parameters have been greater than 99%.

Table 2 - Data Capture Statistics

Month/Parameter	10m WS	10m WD/ST	Temp/DT	Solar Rad	BaroPress	RelHum	Precip
Jul-16	81.5	81.5	81.5	71.4	80.1	81.5	81.3

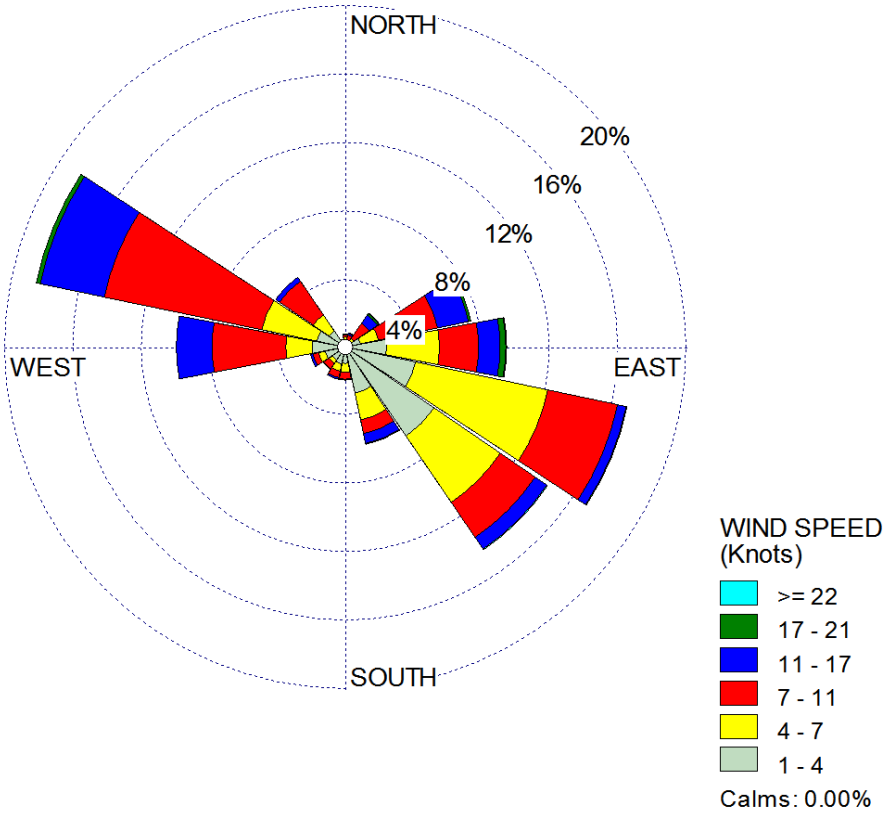
Quarter 4							
Total	93.8	93.8	93.8	56.7	83.1	43.5	93.7



Note: The reported valid data capture rates are the percentage of the possible hours for each month, quarter, and total period.

4.0 DATA RESULTS

Appendix B presents plots of monthly data and monthly data tables for the reporting period.

Figure 1 presents a plot of the quarterly 10-meter wind speed and wind direction data in a format called a "wind rose" plot. This wind rose indicates that there are two predominate wind directions at the site; one from the east (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours). This is similar to wind patterns previously observed.

Figure 1 – 10m Wind Rose Plot

Wind directions are the direction the wind is blowing FROM.

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the 10-meter tower data validation report for the period October through December 2016. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses instrument calibration and audit results, data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the data screening results. Appendix B presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

The tower data was remotely collected and reviewed on a regular basis. There were no significant operational events occurred during the period.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

A calibration of the ST-10 meteorological equipment was performed on November 22, 2016, and the calibration results are presented in Appendix A. The calibrations demonstrate that the meteorological systems were operating within the acceptable DQO ranges, as listed in the project's QAPP Table B-1. The QAPP does not list calibration DQOs for the parameters collected at ST-10 that are not used in AERMOD dispersion modeling, those parameters being pressure, precipitation, and relative humidity. The DQOs that were used to validate these three additional parameters are listed in Tables 0-7 and 0-8 in EPA's *Quality Assurance Handbook for Air Pollution Measurement Systems - Volume IV: Meteorological Measurements Version 2.0* (March 2008), which list PSD measurement DQOs.

A quality assurance performance audit was also conducted on the ST-10 meteorological tower on November 22, 2016, before any tower calibrations or adjustments were made. This audit was performed by independent personnel, using independent certified audit standards. The results from this audit are also presented in Appendix A, and indicate that the meteorological systems were operating within the acceptable DQO ranges.

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.
- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software

screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.

- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses. Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). If the comparisons fall outside of typical ranges, the record is flagged for further inspection. Table 1 summarizes the data screening and validation criteria used for the 10 meter meteorological tower parameters.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were -3.1, -3.9, and -4.7 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%

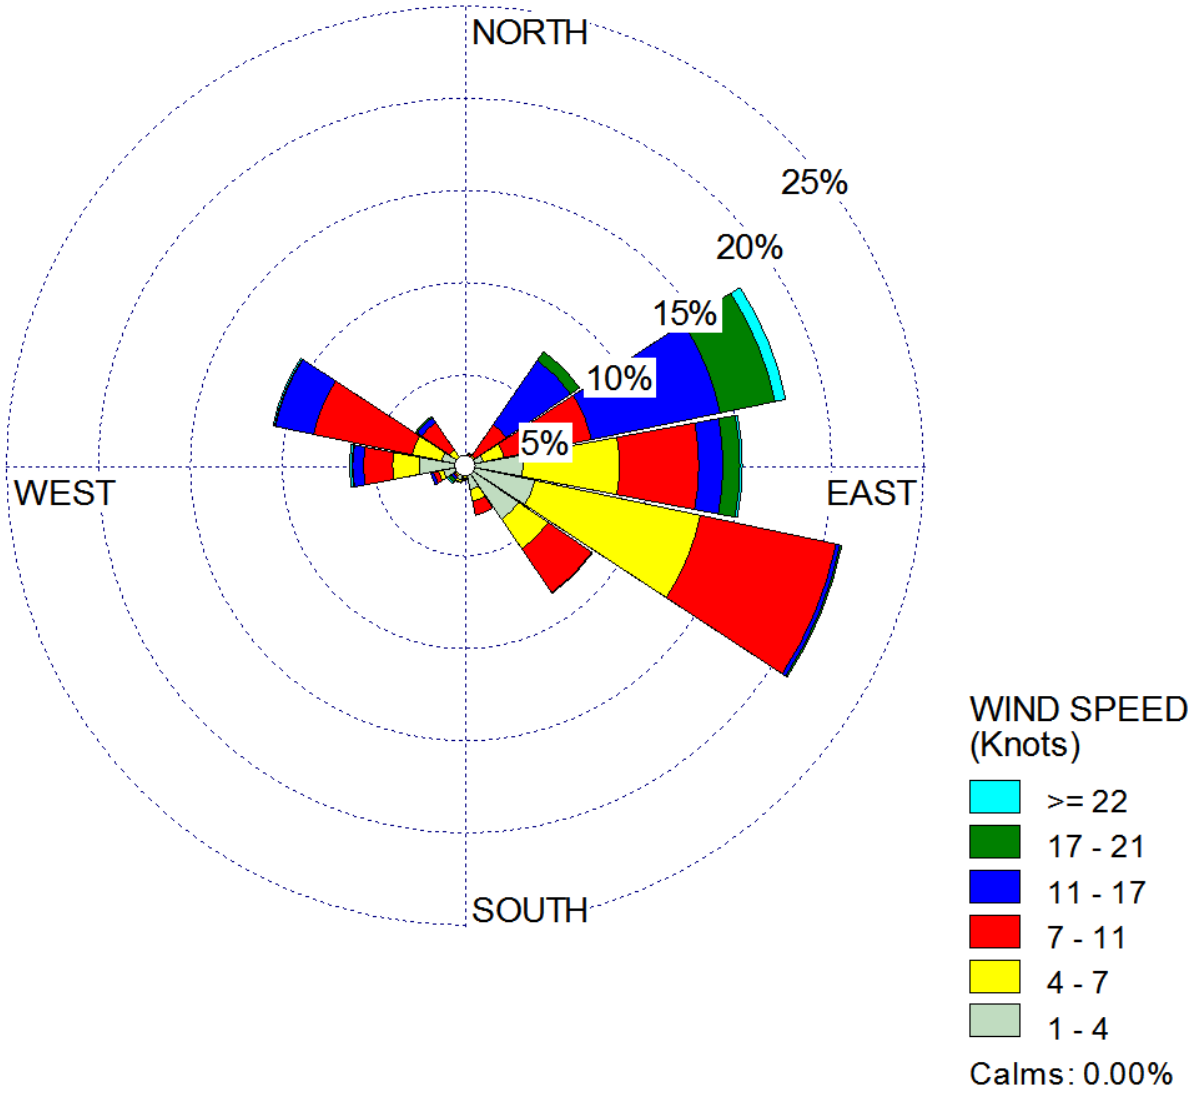
Appendix A presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix A presents comments from the manual review, including any necessary data edits.

3.3 Data Capture Statistics

Based on the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 2 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis. All parameters met these quarterly data capture goals.

Table 2 - Data Capture Statistics

Month/Parameter	10m WS	10m WD/ST	Temp/DT	Solar Rad	BaroPress	RelHum	Precip
Jul-16	81.5	81.5	81.5	71.4	80.1	81.5	81.3
Aug-16	99.7	99.7	99.7	41.3	69.6	11.6	99.6
Sep-16	99.9	99.9	99.9	57.9	99.6	38.6	99.9
Oct-16	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Nov-16	99.6	99.6	99.6	99.6	99.2	99.6	99.6
Dec-16	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Jan-17							
Feb-17							
Mar-17							
Apr-17							
May-17							
Jun-17							
Quarter 1	93.8	93.8	93.8	56.7	83.1	43.5	93.7
Quarter 2	99.9	99.9	99.9	99.9	99.7	99.9	99.9
Quarter 3							
Quarter 4							
Total	96.8	96.8	96.8	78.2	91.4	71.5	96.8



Note: The reported valid data capture rates are the percentage of the possible hours for each month, quarter, and total period.

4.0 DATA RESULTS

Appendix B presents plots of monthly data and monthly data tables for the reporting period.

Figure 1 presents a plot of the quarterly 10-meter wind speed and wind direction data in a format called a "wind rose" plot. This wind rose indicates that there are two predominate wind directions at the site; one from the east (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours). This is similar to wind patterns previously observed for the October through December time period.

Figure 1 – 10m Wind Rose Plot

Wind directions are the direction the wind is blowing FROM.

WIND SPEED SENSOR DATA

RPM Input	Target Speed (mph)	Logger Speed (mph)	Difference (mph)	Difference %
0	0.0	0.4	0.4	NA
300	3.4	3.4	0.0	-0.1%
900	10.3	10.3	0.0	0.0%
1800	20.6	20.6	0.0	0.0%
3600	41.2	41.2	0.0	0.0%
6000	68.7	68.7	0.0	0.0%

Acceptable Tolerance is 0.2 mps or 5%, whichever is greater

Sensor Torque 0.5 mps threshold is 1 gr/cm Found at 0.7 gr/cm

WIND DIRECTION SENSOR DATA

Fixture Index	Target Direction	Logger Output	Difference (degrees)
5	1	4	3
45	41	44	3
90	86	90	4
135	131	133	2
180	176	178	2
225	221	222	1
270	266	268	2
315	311	311	0

Note: Readings adjusted for data logger offset

Magnetic Deviation (east is positive) = 10.3

Vane alignment rod (magnetic) = 349

Alignment (true) = 359

Data Logger Offset = -4

Acceptable Tolerance is 3 degrees linearity, 5 degrees total

Sensor Torque 0.5 mps threshold is 11 gr/cm Found at 9 gr/cm

TEMPERATURE SYSTEM DATA

Standard Reading	2 M Logger Temperature	Difference (degrees)	10 M Logger Temperature	Difference (degrees)	Logger Delta Temperature
0.2	0.1	-0.1	0.1	-0.1	-0.01
19.9	19.9	0.0	19.9	0.0	0.09
42.4	42.7	0.3	42.7	0.3	0.03

Acceptable Tolerance is 0.5C absolute, 0.1C for delta temperature

SOLAR RADIATION SENSOR

Standard (kw/m2)	Logger (kw/m2)	Difference (kw/m2)	Difference (% of FS)
N/A	N/A	0.00	0%

No Calibration solar radiation sensor available

Full Scale is 2.0 kw/m2, acceptable tolerance is 5 %

RELATIVE HUMIDITY SENSOR

Standard (% RH)	Logger (% RH)	Difference (% RH)
52.4	58.4	6.0

For RH the DQO limit is ± 7%

BAROMETRIC PRESSURE SENSOR

Standard	Logger	Difference
703.3	704.04	0.7

Acceptable tolerance is 2.3 mm Hg

PRECIPITATION SENSOR

INPUT (inches)	Logger (inches)	Difference (inches)
0.20	0.20	0.00

Note: Input 100 ml for a target of 0.20 inches (20 tips).

The water must be input over at least 5 minutes.

Input starts at 10:48 to 10:58, 20 tips counted.

Comments:

Calibration start 09:00

Calibration end 11:10

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the 10-meter tower data validation report for the period January through March 2018. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses instrument calibration and audit results, data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the calibration data and data screening results. Appendix B presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

On January 4, 2018, an "as-found" calibration was performed on the ST-10 wind sensor, the sensor was replaced with a new sensor, and an "as-left" calibration of the new sensor was performed. On January 9, 2018, an "as-left" bearing check was performed on the new sensor. All calibration results were within QC tolerances. There were no other significant operational events during the reporting period.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

Calibrations of the wind sensors were performed on January 4 and 9, 2018, and the calibration results are presented in Appendix A.

A quality assurance performance audit was not performed during the reporting period.

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.
- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.
- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses.

Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). If the comparisons fall outside of typical ranges, the record is flagged for further inspection. Table 1 summarizes the data screening and validation criteria used for the 10 meter meteorological tower parameters.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were 0.0, -3.5, and -4.4 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%

Appendix A presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix A presents comments from the manual review, and no data edits were required.

3.3 Data Capture Statistics

Based on the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 2 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis. All parameters met these quarterly data capture goals.

Table 2 - Data Capture Statistics

Month/Parameter	10m WS	10m WD/ST	Temp/DT	Solar Rad	BaroPress	RelHum	Precip
Jan-18	99.1	99.1	99.1	99.1	99.1	99.1	99.1

Note: The reported valid data capture rates are the percentage of the possible hours for each month, quarter, and total period.

4.0 DATA RESULTS

Appendix B presents plots of monthly data and monthly data tables for the reporting period.

Figure 1 presents a plot of the quarterly valid 10-meter wind speed and wind direction data in a format called a "wind rose" plot. This wind rose indicates that there are two predominate wind directions at the site; one from the east-southeast (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours with higher wind speeds). This is similar to wind patterns previously observed at the monitoring site.

Figure 1 – 10m Wind Rose Plot

Wind directions are the direction the wind is blowing FROM.

APPENDIX A

Data Screening and Validation Results

ASARCO ST-10 10-Meter Data - QA Screen Test Results for Jan-March 2018 - Note that WS is in m/s, Temp and Delta T are in C, and Solar Rad is in kw/m2
Parameters include Wind Speed and Direction (WS WD), Sigma Theta (ST), Temperature and Delat T (TP and D1) and Solar Radiation (SR)

ITYPE	PARM	DATE	CODE	Value	Comments
4	WS	18010523	WIND SPD TOO CONSTANT 3 HR	0.2	Steady WD also - WS is valid

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the 10-meter tower data validation report for the period April through June 2018. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses instrument calibration and audit results, data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the audit results, and Appendix B the data screening results. Appendix C presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

There were no significant operational events during the reporting period.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

A performance audit of all equipment was performed on May 30, 2018. Audit results are presented in Appendix A. The results indicate that the meteorological systems were operating within the acceptable DQO ranges.

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.
- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.
- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses. Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data

were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). If the comparisons fall outside of typical ranges, the record is flagged for further inspection. Table 1 summarizes the data screening and validation criteria used for the 10 meter meteorological tower parameters.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were -2.6, -3.3, and -4.2 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%

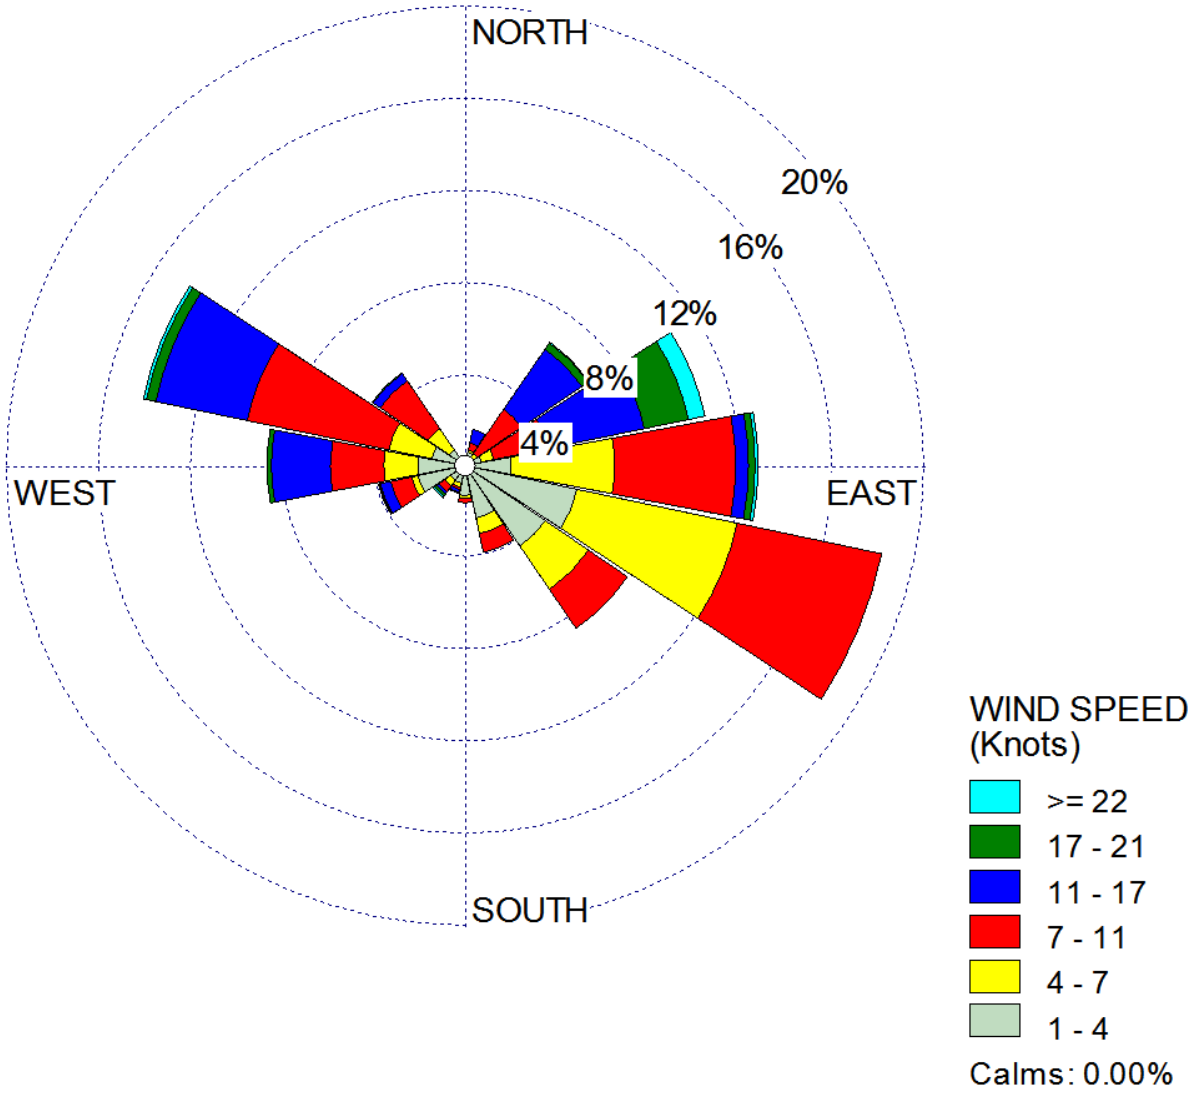
Appendix B presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix A presents comments from the manual review, and no data edits were required.

3.3 Data Capture Statistics

Based on the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 2 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis. All parameters met these quarterly data capture goals.

Table 2 - Data Capture Statistics

Month/Parameter	10m WS	10m WD/ST	Temp/DT	Solar Rad	BaroPress	RelHum	Precip
Jan-18	99.1	99.1	99.1	99.1	99.1	99.1	99.1
Feb-18	100	100	100	100	100	100	100
Mar-18	100	100	100	100	99.5	99.5	100
Apr-18	100	100	100	100	100	100	100
May-18	99.5	99.5	99.5	99.5	100	100	99.5
Jun-18	100	100	100	100	100	100	100
Jul-18							
Aug-18							
Sep-18							
Oct-18							
Nov-18							
Dec-18							
Quarter 1	99.7	99.7	99.7	99.7	99.5	99.5	99.7
Quarter 2	99.8	99.8	99.8	99.8	100.0	100.0	99.8
Quarter 3	0.0	0.0	0.0	0.0	0.0	0.0	0.0
Quarter 4	0.0	0.0	0.0	0.0	0.0	0.0	0.0
Total	99.8	99.8	99.8	99.8	99.8	99.8	99.8



Note: The reported valid data capture rates are the percentage of the possible hours for each month, quarter, and total period.

4.0 DATA RESULTS

Appendix C presents plots of monthly data and monthly data tables for the reporting period.

Figure 1 presents a plot of the quarterly valid 10-meter wind speed and wind direction data in a format called a "wind rose" plot. This wind rose indicates that there are two predominate wind directions at the site; one from the east-southeast (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours with higher wind speeds). This is similar to wind patterns previously observed at the monitoring site.

Figure 1 – Quarterly 10m Wind Rose Plot

Wind directions are the direction the wind is blowing FROM.

APPENDIX A

Audit Results

AMSTECH

WIND SPEED SENSOR AUDIT REPORT

PART A: ANCILLARY INFORMATION

Project: RTP / ASARCO - ST10 **Date:** 30-May-2018 **Auditor:** D. Meisters
Site ID: ST10 **Start (MST):** 1130 **Witness:** K. Ford
Location: Hayden, AZ **END (MST):** 1156 S. Cooper

- ***STATION WIND SPEED SENSOR IDENTIFICATION and APPLICATION***

Make: R.M.YOUNG **Range, mps:** 0 to 50
Model: 05305 **Sensor Height, m:** 10 (not measured)
SN: 158704 **Propeller SN:** 76663

- ***AUDIT EQUIPMENT IDENTIFICATION and DESCRIPTION***

Item: R.M.Y., 18802, high rpm motor **SN:** CA02444 **Exp.:** 16-Jan-2019
Item: R.M.Y., 18310, propeller torque disk **SN:** N/A **Exp.:** N/A

PART B: AUDIT TEST RESULTS

- ***KNOWN AUDIT INPUT vs. OBSERVED STATION RESPONSE***

Starting Torque Threshold: 0.1 gm-cm = 0.16 mps.

Audit Inputs		Station Response	
Motor rpm	Known mps	DAS mps	Error mps
0.0	0.00	0.00	0.00
400	2.05	2.05	0.00
1,200	6.14	6.14	0.00
4,000	20.48	20.48	0.00
8,000	40.96	40.96	0.00

- ***AUDITOR COMMENTS or OBSERVATIONS***

DAS time = 0945; Local standard time = 0940.
The data loger time is approximately 5 minutes and 30 seconds fast.
1035 - Tower down; instruments removed.
1050 - Tower up; to allow solar audit and sight vane alignment rod.
1240 - Tower down; instruments reinstalled.
1300 - Tower up. All parameters on-line.
No problems found with the WS response.

- ***AUDIT LIMIT CRITERIA and PASS/FAIL RESULTS***

Audit Limit Category	To PASS, the observed response must be....	Pass/Fail
Accuracy	±0.20 mps + 5% of known input per audit test point	PASS
Starting torque threshold	≤0.5 mps.	PASS

KIPP & ZONEN
SINCE 1830

CALIBRATION CERTIFICATE

CERTIFICATE NUMBER	201709020991
PYRANOMETER MODEL	CM 21
SERIAL NUMBER	020991
SENSITIVITY	10.39 µV/W/m² at normal incidence on horizontal pyranometer
IMPEDANCE	39 Ω
REFERENCE PYRANOMETER	Kipp & Zonen CMP 21 sn 100418 active from 01 January 2017
CALIBRATION DATE	29 September 2017
CLASSIFICATION	ISO 9060, Secondary Standard

Calibration procedure

The indoor calibration procedure is based on a side-by-side comparison with a reference pyranometer under an artificial sun fed by an AC voltage stabiliser. It embodies a 150 W Metal-Halide high-pressure gas discharge lamp. Behind the lamp is a reflector with a diameter of 16.2 cm. The reflector is 1 m above the pyranometers producing a vertical beam. The reference and test pyranometers are mounted horizontally on a table, which can rotate. The irradiance at the pyranometers is approximately 500 W/m². During the calibration procedure the reference and test pyranometer are interchanged to correct for any non-homogeneity of the beam. Temperature of calibration: 22±2 °C.

Hierarchy of traceability

The reference pyranometer was compared with the sun and sky radiation as source under clear sky conditions using the "alternating sun-and-shade method" ISO 9846 paragraph 5. The measurements were performed in Bohemia NY (latitude: 40.780°, longitude: -73.105°, altitude: 26m above sea level). Dates of measurements: 2016, August 22,23,24.
The receiver surface was pointed directly at the sun using a solar tracker. During the comparisons, the instrument received tilted global radiation intensities from 745 to 987 with a mean of 914 W/m² and tilted diffuse radiation intensities from 75 to 109 with a mean of 95 W/m².
The ambient temperature ranged from +21.6 to +31.4 with a mean of +26.3 °C.
The direct radiation on the reference pyranometer as obtained with the alternating-sun-shade method was compared to the DNI measured by the absolute cavity pyrheliometer PMO6 SN 103. The PMO6 is calibrated against the World Standard Group (WSG), maintained at the WRC Davos every International Pyrheliometer Comparison (IPC). The PMO6 participates every IPC since 2005 and it participates in the yearly NPC hosted by NREL in Golden, Colorado to verify its stability. WRR factor of PMO6: 0.997916 (from the last IPC, IPC-2015).

This calibration proved that the reference pyranometer has been stable and that the original sensitivity 9.80 ± 0.12 µV/W/m² is valid and will be applied (see PMOD calibration details). Observed sensitivity differences between the consecutive years are well within the calibration uncertainty.

PMOD calibration details: The reference pyranometer was compared with the sun and sky radiation as source under mainly clear sky conditions using the "continuous sun-and-shade method". The pyranometer was installed horizontally. During the comparisons, the global radiation ranged from 665 to 1082 with a mean of 897 W/m². The solar zenith angle varied from 25.3 to 50.0 with a mean of 33.7 degrees. The ambient temperature ranged from +15.3 to +25.3 with a mean of +20.7 °C. The sensitivity calculation is based on 626 individual measurements. The readings of the WSG are referred to the World Radiometric Reference (WRR). The estimated uncertainty of the WRR relative to SI is ±0.3%. The obtained sensitivity value and its expanded uncertainty (95% level of confidence) are valid for similar conditions and are:9.80 ± 0.12 µV/W/m².
The measurements were performed in Davos (latitude: 46.8143°, longitude: -9.8458°, altitude: 1558m above sea level). Dates of measurements: 15-19, 25 July 2014.
Global radiation data were calculated from the direct solar radiation as measured with the absolute cavity pyrheliometer PMO2 (member of the WSG, WRR-Factor: 0.998623, based on the last IPC-2010) and from the diffuse radiation as measured with a continuous disk shaded pyranometer Kipp & Zonen CM22 SN 020059 (ventilated with heated air).

Justification of total instrument calibration uncertainty

The combined uncertainty of the result of the calibration is the positive "root sum square" of two uncertainties.
1. The expanded uncertainty due to random effects and instrumental errors during the calibration of the reference CMP 21 is ± 0.12/9.80 = ± 1.22%. (See traceability text).
2. Based on experience, the expanded uncertainty of the transfer procedure (calibration by comparison) is estimated to be ±0.5%.
The estimated combined expanded uncertainty is the positive "root sum square" of these two uncertainties: $\sqrt{(1.22^2 + 0.5^2)} = \pm 1.32\%$.

Notice

The calibration certificate supplied with the instrument is valid at the date of first use. Even though the calibration certificate is dated relative to manufacture, or recalibration, the instrument does not undergo any sensitivity changes when kept in the original packing. From the moment the instrument is taken from its packaging and exposed to irradiance the sensitivity may deviate with time. See the 'non-stability' value (% change in sensitivity per year) given in the radiometer specifications.

CERTIFICATE OF CALIBRATION AND TESTING

Model: 18802/18811
Serial Number: CA02444

Description: Anemometer Drive - 2 motors, 20 to 15,000 RPM
(18802 comprised of 18820A Control Unit and 18830A Motor Assembly)
(18811 comprised of 18820A Control Unit and 18831A Motor Assembly)

R. M. Young Company certifies that the above equipment was inspected and calibrated prior to shipment in accordance with established manufacturing and testing procedures. Standards established by R.M. Young Company for calibrating the measuring and test equipment used in controlling product quality are traceable to the National Institute of Standards and Technology.

Nominal Motor RPM RPM	27106D Output Frequency Hz (1)	Calculated RPM (2)	Indicated RPM (3)

CERTIFICATE OF CALIBRATION

Equipment Owner

Name: AMS Tech, LLC/David Meisters

Address: 1539 Purple Sage Ct
Fort Collins, CO 80526

This is to certify that the below listed product has been calibrated to comply with manufacturing process controls as established by Brunton Outdoor Inc. The accuracy and stability of all standards maintained by the Brunton Outdoor Group are traceable to the Serial number.

This unit has been calibrated to Brunton Outdoor Specifications this 12th Day February 20 18.

Description Pocket Transit
Purchase Order RMA 17574

250 ml Volumetric Flask Used for Precipitation Gauge Water Volume Measurement

Representative photo only
Thermo Scientific Nalgene Class B polypropylene volumetric flask 250 mL

Thermo Scientific Nalgene Class B volumetric flask, 250 mL

EW-06108-40

These Class B polypropylene volumetric flasks meet ASTM Standard E288 and ISO Standard 384. Flasks have polypropylene screw closures and are leak-proof. Sturdy, heat-resistant flasks are autoclavable. Model 06108-30 has an extra graduation at 203 mL. All flasks are calibrated at 20degC. No meniscus.

Specifications	
Capacity (mL)	250
Tolerance (mL)	±0.24
Material	Polypropylene
Height (cm)	22.2
Quantity	1
Brand	Thermo Scientific Nalgene

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the 10-meter tower data validation report for the period July through September 2018. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the data screening results. Appendix B presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

A power failure at the site began on July 28, 2018, at 0700, resulting in loss of pressure and relative humidity data. The data logger battery backup lasted until July 31, 2018, when all parameters became inoperative. Power was restored on August 3, 2018, at 1300 (note that pressure and relative humidity sensors came back online a few hours later at 2100). There were no other significant operational events during the reporting period.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

Neither calibrations or audits were performed during the reporting quarter.

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.
- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.
- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses. Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). If the comparisons fall outside of typical ranges, the record is flagged for further inspection. Table 1 summarizes the data screening and validation criteria used for the 10 meter meteorological tower parameters.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were -2.6, -3.8, and -4.7 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%

Appendix A presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix A presents comments from the manual review, and no data edits were required.

3.3 Data Capture Statistics

Based on the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 2 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis. All parameters met these quarterly data capture goals.

Table 2 - Data Capture Statistics

Month/Parameter	10m WS	10m WD/ST	Temp/DT	Solar Rad	BaroPress	RelHum	Precip
Jan-18	99.1	99.1	99.1	99.1	99.1	99.1	99.1

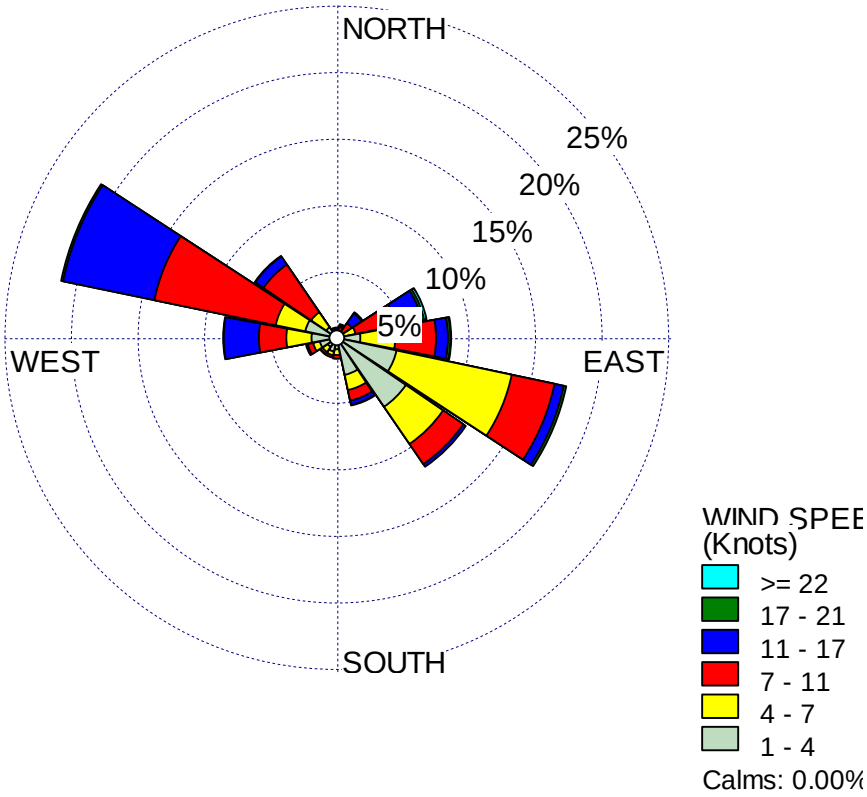
Jul-18	98.0	98.0	98.0	98.0	88.0	88.0	98.0
Aug-18	91.7	91.7	91.7	91.7	90.6	90.6	91.7
Sep-18	100	100	100	100	100	100	100
Oct-18							
Nov-18							
Dec-18							
Quarter 1	99.7	99.7	99.7	99.7	99.5	99.5	99.7
Quarter 2	99.8	99.8	99.8	99.8	100.0	100.0	99.8
Quarter 3	96.5	96.5	96.5	96.5	92.8	92.8	96.5
Quarter 4							
Total	98.7	98.7	98.7	98.7	97.4	97.4	98.7



Note: The reported valid data capture rates are the percentage of the possible hours for each month, quarter, and total period.

4.0 DATA RESULTS

Appendix C presents plots of monthly data and monthly data tables for the reporting period.

Figure 1 presents a plot of the quarterly valid 10-meter wind speed and wind direction data in a format called a "wind rose" plot. This wind rose indicates that there are two predominate wind directions at the site; one from the east-southeast (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours with higher wind speeds). This is similar to wind patterns previously observed at the monitoring site.

Figure 1 – Quarterly 10m Wind Rose Plot

Wind directions are the direction the wind is blowing FROM.

APPENDIX A

Data Screening and Validation Results

ASARCO ST-10 10-Meter Data - QA Screen Test Results for July - Sept 2018 - Note that WS is in m/s, Temp and Delta T are in C, and Solar Rad is in kw/m2
Parameters include Wind Speed and Direction (WS WD), Sigma Theta (ST), Temperature and Delat T (TP and D1) and Solar Radiation (SR)

ITYPE	PARM	DATE	CODE	Value	Comments
4	WS	18070706	WIND SPD TOO CONSTANT 3 HR	0.11	Light to moderate winds in stable early morning period - WS is valid

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the 10-meter tower data validation report for the period October 2018 through March 2019. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the audit and calibration results. Appendix B presents the data screening results. Appendix C presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

There were no significant operational events during the reporting period, besides the audit and calibration that occurred on January 16, 2019.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

A performance audit of all equipment was performed on January 16, 2019. Audit results are presented in Appendix A, and they indicate that the meteorological systems were operating within the acceptable DQO ranges. A calibration was performed immediately after the audit; those results are also presented in Appendix A and they also indicate acceptable instrument accuracy.

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.
- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.
- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses. Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). If the comparisons fall outside of typical ranges, the record is flagged for further inspection. Table 1 summarizes the data screening and validation criteria used for the 10 meter meteorological tower parameters.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were -3.2, 0.0, and -4.0 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%

Appendix B presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix B presents comments from the manual review.

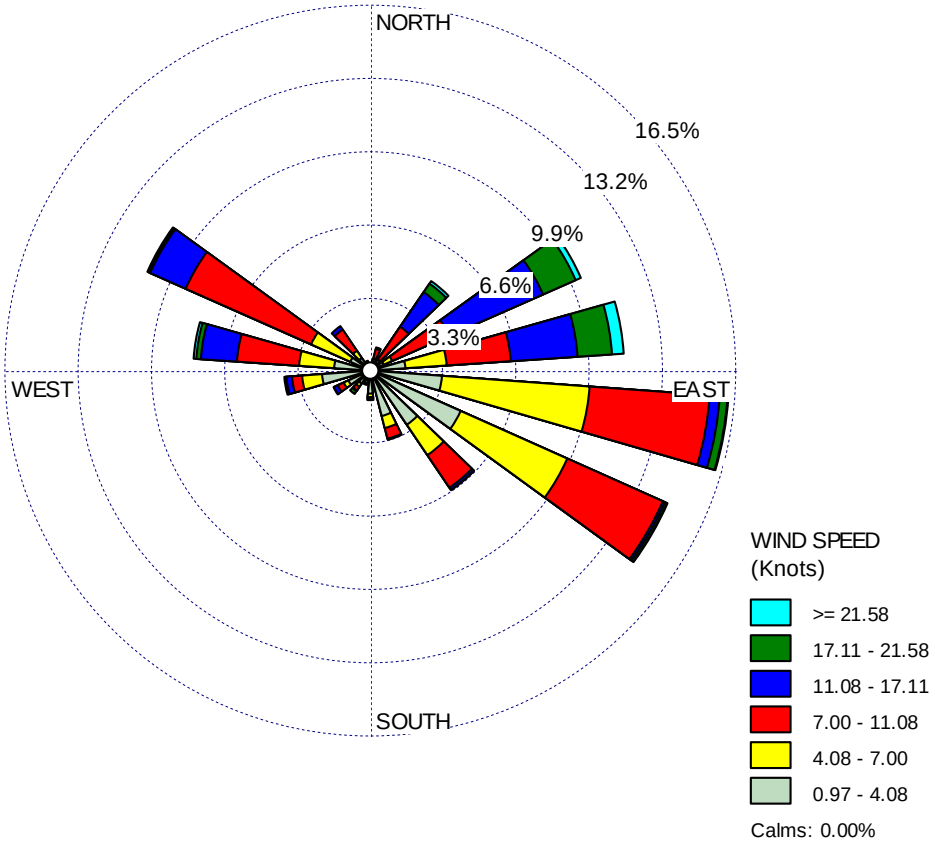
The only data edits that were required were related to the precipitation sensor. During a site inspection on October 31, 2018, it was noted that insects had blocked the opening on the precipitation sensor bucket. A detailed comparison of the ST-10 precipitation data to other nearby ASARCO precipitation sensors was performed, which clearly indicated that the ST-10 sensor began to read low as of October 7, 2018. Therefore, all ST-10 precipitation data was invalidated from October 7, 2018, at 09:00 until October 31, 2018, at 11:00.

3.3 Data Capture Statistics

Based on the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 2 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis. All parameters met these data capture goals, except for the precipitation sensor for the 4th quarter 2018.

Table 2 - Data Capture Statistics

Month/Parameter	10m WS	10m WD/ST	Temp/DT	Solar Rad	BaroPress	RelHum	Precip
Oct-18	100	100	100	100	100	100	22.4
Nov-18	100	100	100	100	100	100	100
Dec-18	100	100	100	100	100	100	100
Jan-19	99.3	99.3	99.3	99.3	99.3	99.3	99.3
Feb-19	100	100	100	100	100	100	100
Mar-19	100	100	100	100	100	100	100
Apr-19							
May-19							
Jun-19							
Jul-19							
Aug-19							
Sep-19							
Quarter 1	100.0	100.0	100.0	100.0	100.0	100.0	73.3
Quarter 2	99.8	99.8	99.8	99.8	99.8	99.8	99.8
Quarter 3							
Quarter 4							
Total	99.9	99.9	99.9	99.9	99.9	99.9	86.6



Note: The reported valid data capture rates are the percentage of the possible hours for each month, quarter, and total period.

4.0 DATA RESULTS

Appendix C presents plots of monthly data and monthly data tables for the reporting period.

Figure 1 presents a plot of the quarterly valid 10-meter wind speed and wind direction data in a format called a "wind rose" plot. This wind rose indicates that there are two predominate wind directions at the site; one from the east-southeast (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours with higher wind speeds). This is similar to wind patterns previously observed at the monitoring site.

Figure 1 – 10m Wind Rose Plot

Wind directions are the direction the wind is blowing FROM.

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the 10-meter tower data validation report for the period April through September 2019. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the audit and calibration results. Appendix B presents the data screening results. Appendix C presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

With the exception of precipitation data, no data was collected from the station on May 22, 2019 between 9am and 11pm; the cause of the data gap is unknown. No data was collected from the station on July 30, 2019 between 10am and 12pm, when replacement of the anemometer was attempted (as discussed in Section 3.1 below). A power failure occurred at the site on September 1, 2019. The data logger battery backup kept the logger collecting data until 1:00 am on September 4, 2019 (except for relative humidity and barometric pressure, as those sensors require AC power). AC power was restored at noon on September 4, 2019. There were no other significant operational events during the reporting period besides an audit conducted on July 10, 2019, and calibrations performed on the precipitation gauge on August 14, 2019 and September 19, 2019.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

A performance audit of all equipment was performed on July 10, 2019. Audit results are presented in Appendix A, and they indicate that the meteorological systems were operating within the acceptable DQO ranges, with one exception. The wind direction sensor starting torque threshold was slightly higher than the DQO. A calibration was performed immediately after the audit; those results are also presented in Appendix A and they also indicate acceptable instrument accuracy, again with the exception of the wind direction sensor starting torque. A replacement of the wind direction sensor was attempted on July 30, 2019, however the replacement was not completed due to the inability to calibrate the new instrument properly, and the existing anemometer was reinstalled. Replacement of the anemometer is still scheduled when parts are received. The precipitation sensor was also calibrated on August 14 and September 19, 2019.

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.
- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.
- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses. Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). If the comparisons fall outside of typical ranges, the record is flagged for further inspection. Table 1 summarizes the data screening and validation criteria used for the 10 meter meteorological tower parameters.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were -1.7, -2.8, and -5.0 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%

Appendix B presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix B presents comments from the manual review.

No data edits were required during the data processing.

In the digital data file that accompanies this data validation report, each hourly data point has been assigned a QC code as listed in Table 8-3 of EPA's Met Monitoring Guidance. The QC codes used were:

Code 0 - valid data,

Code 2 - valid data with corrections (i.e., data with readily identifiable offsets and simple corrections),

Code 7 – suspect data (i.e., lack of calibration documentation, and/or inconsistencies between Level 2 intercomparisons),

Code 8 - invalid data (inconsistent readings between "as-left" and "as-found" calibrations that make developing a correction factor impossible).

Note that all invalid data also has a value of 999.0 in the data file.

3.3 Data Capture Statistics

Based on the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 2 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis. All parameters met these data capture goals for the April through September 2019 period.

Table 2 - Data Capture Statistics

Month/Parameter	10m WS	10m WD/ST	Temp/DT	Solar Rad	BaroPress	RelHum	Precip
Oct-18	100	100	100	100	100	100	22

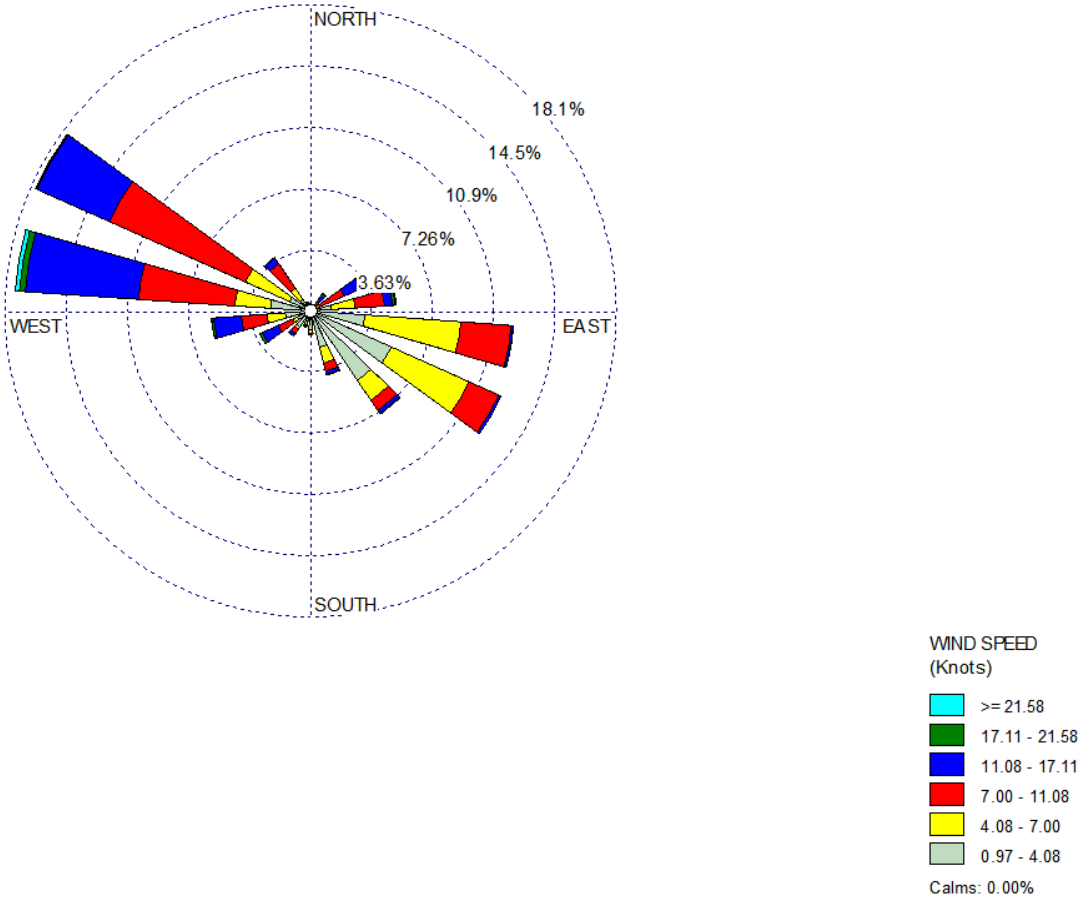
Apr-19	100.0	100.0	100.0	100.0	100.0	100.0	100.0
May-19	98.0	98.0	98.0	98.0	98	98	100.0
Jun-19	100	100	100	100	100	100	100
Jul-19	98.9	98.9	98.9	98.9	98.9	98.9	98.9
Aug-19	100	100	100	100	100	100	100
Sep-19	98.3	98.3	98.3	98.3	89.4	89.4	98.1
Quarter 1	100.0	100.0	100.0	100.0	100.0	100.0	73.3
Quarter 2	99.8	99.8	99.8	99.8	99.8	99.8	99.8
Quarter 3	99.3	99.3	99.3	99.3	99.3	99.3	100.0
Quarter 4	99.1	99.1	99.1	99.1	96.1	96.1	99.0
Total	99.5	99.5	99.5	99.5	98.8	98.8	93.1



Note: The reported valid data capture rates are the percentage of the possible hours for each month, quarter, and total period.

4.0 DATA RESULTS

Appendix C presents plots of monthly data and monthly data tables for the reporting period.

Figure 1 presents a plot of the quarterly valid 10-meter wind speed and wind direction data in a format called a "wind rose" plot. This wind rose indicates that there are two predominate wind directions at the site; one from the east-southeast (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours with higher wind speeds). This is similar to wind patterns previously observed at the monitoring site.

Figure 1 – 10m Wind Rose Plot

Wind directions are the direction the wind is blowing FROM.

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the 10-meter tower data validation report for the period October 2019 through March 2020. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the audit and calibration results. Appendix B presents the data screening results. Appendix C presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

An audit and a calibration of the system was performed on January 23, 2020. There were no other significant operational events during the reporting period.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

A performance audit of all equipment was performed on January 23, 2020, and a calibration was performed immediately after the audit. Audit and calibration results are presented in Appendix A, and they indicate that the meteorological systems were operating within the acceptable DQO ranges, with two exceptions.

First, the wind direction sensor starting torque threshold was slightly higher than the DQO during both the audit and calibration. The readings indicate a wind direction starting threshold of 0.6 m/sec instead of the target 0.5 m/sec. This small difference did not warrant any adjustments or invalidation of the wind direction data. As part of the calibration, the wind direction sensor

was replaced, and an "as-left" calibration was performed. The results from the "as-left" wind direction calibration were within the acceptable DQO ranges.

Second, the calibration of the relative humidity sensor indicated that the accuracy was slightly outside of DQO limits, with the measured accuracy at +12.9% versus the DQO limit of 7% (note that an audit is not performed on the relative humidity sensor). The sensor accuracy was checked again during another calibration on June 30, 2020, and was found to be at +8.2% high. Therefore, the relative humidity sensor was replaced on July 9, 2020, and a calibration indicated the new sensor was within the DQO accuracy limit. The relative humidity data has been flagged with a validation code of 7 (i.e., suspect data) for the time period from the last acceptable calibration on July 10, 2019, through July 9, 2020, but the relative humidity data is still being reported rather than invalidated because the accuracy errors were only slightly greater than the DQO limit.

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.
- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.
- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses. Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). If the comparisons fall outside of typical ranges, the record is flagged for further inspection. Table 1 summarizes the data screening and validation criteria used for the 10 meter meteorological tower parameters.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were -2.8, -3.5, and -4.5 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%

Appendix B presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix B presents comments from the manual review.

No data edits were required during the data screening and validation process.

In the digital data file that accompanies this data validation report, each hourly data point has been assigned a QC code as listed in Table 8-3 of EPA's Met Monitoring Guidance. The QC codes used were:

Code 0 - valid data,

Code 2 - valid data with corrections (i.e., data with readily identifiable offsets and simple corrections),

Code 7 – suspect data (i.e., lack of calibration documentation, and/or inconsistencies between Level 2 intercomparisons),

Code 8 - invalid data (inconsistent readings between "as-left" and "as-found" calibrations that make developing a correction factor impossible).

Note that all invalid data also has a value of 999.0 in the data file.

3.3 Data Capture Statistics

Based on the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 2 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis. All parameters met these data capture goals for the reporting period.

Table 2 - Data Capture Statistics

Month/Parameter	10m WS	10m WD/ST	Temp/DT	Solar Rad	BaroPress	RelHum	Precip
Oct-19	100.0	100.0	100.0	100.0	100.0	100.0	100.0

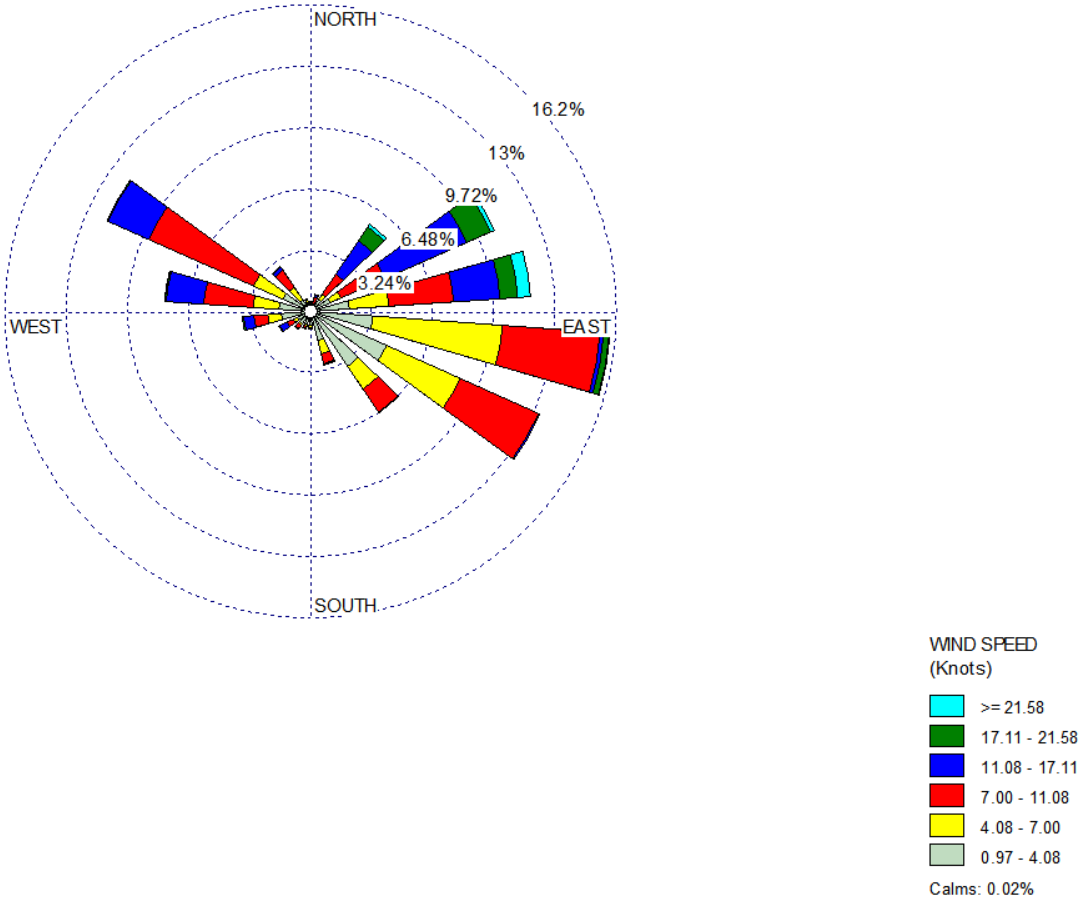
Quarter 1	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Quarter 2	99.9	99.9	99.9	99.9	99.9	99.9	99.9
Quarter 3							
Quarter 4							
Total	99.9	99.9	99.9	99.9	99.9	99.9	99.9



Note: The reported valid data capture rates are the percentage of the possible hours for each month, quarter, and total period.

4.0 DATA RESULTS

Appendix C presents plots of monthly data and monthly data tables for the reporting period.

Figure 1 presents a plot of the quarterly valid 10-meter wind speed and wind direction data in a format called a "wind rose" plot. This wind rose indicates that there are two predominate wind directions at the site; one from the east-southeast (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours with higher wind speeds). This is similar to wind patterns previously observed at the monitoring site.

Figure 1 – 10m Wind Rose Plot

Wind directions are the direction the wind is blowing FROM.

WD Sensor Torque 0.5 mps threshold is 11 gr/cm Found at 15 gr/cm

As Left WIND DIRECTION SENSOR DATA

Fixture Index	Target Direction	Logger Output	Difference (degrees)
5	1	2	1
45	41	43	2
90	86	88	2
135	131	132	1
180	176	177	1
225	221	221	0
270	266	267	1
315	311	312	1

TEMPERATURE SYSTEM DATA

Standard Reading	2 M Logger Temperature	Difference (degrees)	10 M Logger Temperature	Difference (degrees)	Logger Delta Temperature
0.1	0.10	0.0	0.10	0.0	0.03
18.8	18.80	0.0	18.90	0.1	0.06
42.6	42.90	0.3	43.00	0.4	0.10

Acceptable Tolerance is 0.5C absolute, 0.1C for delta temperature

RELATIVE HUMIDITY SENSOR

Standard (% RH)	Logger (% RH)	Difference (% RH)
64.1	76.9	12.8

For RH the DQO limit is ± 7%

BAROMETRIC PRESSURE SENSOR

(mm Hg)	(mm Hg)	(mm Hg)
704.7	706	1.3

Acceptable tolerance is 2.3 mm Hg

PRECIPITATION SENSOR

INPUT (inches)	Logger (inches)	Difference (inches)
0.20	0.20	0.00

counted 20

Note: Input 100 ml for a target of 0.20 inches (20 tips).
The water must be input over at least 5 minutes.

Comments:

Calibration start 08:22 mst

Calibration end 10:50 mst

Replaced wind monitor assembly

New Wind Monitor SN: wm154835, prop is 08254 SN: 73527

APPENDIX B

Data Screening and Validation Results

ASARCO ST-10 10-Meter Data - QA Screen Test Results for Oct 2019 thru March 2020 - Note that WS is in m/s, Temp and Delta T are in C, and Solar Rad is in kw/m2
Parameters include Wind Speed and Direction (WS WD), Sigma Theta (ST), Temperature and Delat T (TP and D1) and Solar Radiation (SR)

ASARCO ST-10 10-Meter Data - QA Screen Test Results for Oct 2019 thru March 2020 - Note that WS is in m/s, Temp and Delta T are in C, and Solar Rad is in kw/m2
Parameters include Wind Speed and Direction (WS WD), Sigma Theta (ST), Temperature and Delat T (TP and D1) and Solar Radiation (SR)

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the 10-meter tower data validation report for the period April through September 2020. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the audit and calibration results. Appendix B presents the data screening results. Appendix C presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

An audit and calibration of the system was performed on July 9, 2020. There were no other significant operational events during the reporting period.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

A performance audit of all equipment was performed on July 9, 2020, and a calibration was performed immediately after the audit. Audit and calibration results are presented in Appendix A, and they indicate that the meteorological systems were operating within the acceptable DQO ranges. It should be noted that due to the results of the previous audit performed on January 23, 2020, which indicated the relative humidity sensor accuracy was slightly outside of DQO limits, the relative humidity sensor was checked on June 30, 2020, and was found to be reading +8.2% high, outside of the DQO limit of ± 7%. Therefore, the relative humidity sensor was replaced during the calibration on July 9, 2020, and the calibration indicated the new sensor was within the DQO accuracy limit. The relative humidity data has been flagged with a validation code of 7 (i.e., suspect data) for the time period from the last acceptable calibration on July 10, 2019,

through July 9, 2020, but the relative humidity data is still being reported rather than invalidated because the previous accuracy errors were only slightly greater than the DQO limit.

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.
- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.
- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses. Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). If the comparisons fall outside of typical ranges, the record is flagged for further inspection. Table 1 summarizes the data screening and validation criteria used for the 10 meter meteorological tower parameters.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western

Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were -1.6, -3.5, and -5.1 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%

Appendix B presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix B presents comments from the manual review.

No data edits were required during the data screening and validation process.

In the digital data file that accompanies this data validation report, each hourly data point has been assigned a QC code as listed in Table 8-3 of EPA's Met Monitoring Guidance. The QC codes used were:

Code 0 - valid data,

Code 2 - valid data with corrections (i.e., data with readily identifiable offsets and simple corrections),

Code 7 – suspect data (i.e., lack of calibration documentation, and/or inconsistencies between Level 2 intercomparisons),

Code 8 - invalid data (inconsistent readings between "as-left" and "as-found" calibrations that make developing a correction factor impossible).

Note that all invalid data also has a value of 999.0 in the data file.

3.3 Data Capture Statistics

Based on the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 2 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis. All parameters met these data capture goals for the reporting period.

Table 2 - Data Capture Statistics

Month/Parameter	10m WS	10m WD/ST	Temp/DT	Solar Rad	BaroPress	RelHum	Precip
Oct-19	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Nov-19	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Dec-19	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Jan-20	99.6	99.6	99.6	99.6	99.6	99.6	99.6
Feb-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0

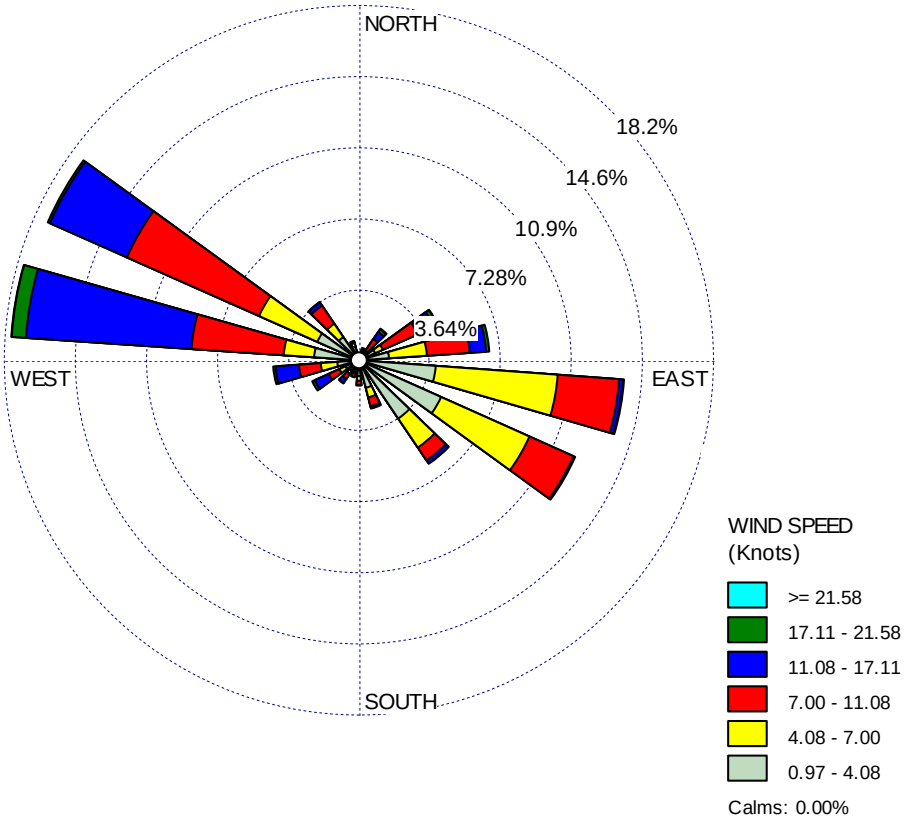
Apr-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
May-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Jun-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Jul-20	99.6	99.6	99.6	99.6	99.6	99.6	99.6
Aug-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Sep-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Quarter 1	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Quarter 2	99.9	99.9	99.9	99.9	99.9	99.9	99.9
Quarter 3	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Quarter 4	99.9	99.9	99.9	99.9	99.9	99.9	99.9
Total	99.9	99.9	99.9	99.9	99.9	99.9	99.9



Note: The reported valid data capture rates are the percentage of the possible hours for each month, quarter, and total period.

4.0 DATA RESULTS

Appendix C presents plots of monthly data and monthly data tables for the reporting period.

Figure 1 presents a plot of the quarterly valid 10-meter wind speed and wind direction data in a format called a "wind rose" plot. This wind rose indicates that there are two predominate wind directions at the site; one from the east-southeast (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours with higher wind speeds). This is similar to wind patterns previously observed at the monitoring site.

Figure 1 – 10m Wind Rose Plot

Wind directions are the direction the wind is blowing FROM.

AS Found WIND SPEED SENSOR DATA

RPM Input	Target Speed (mph)	Logger Speed (mph)	Difference (mph)	Difference %
0	0.0	0.0	0.0	NA
410	4.7	4.8	0.1	2.2%
900	10.3	10.3	0.0	0.0%
1500	17.2	17.2	0.0	0.0%
3000	34.4	34.4	0.0	0.0%
6000	68.7	68.7	0.0	0.0%

Acceptable Tolerance is 0.2 mps or 5%, whichever is greater

Sensor Torque 0.5 mps threshold is 1 gr/cm Found at 0.8 gr/cm

As Found WIND DIRECTION SENSOR DATA

Fixture Index	Target Direction	Logger Output	Difference (degrees)
5	0	3	3
45	40	43	3
90	85	89	4
135	130	134	4
180	175	177	2
225	220	221	1
270	265	267	2
315	310	313	3
360	355	357	2

Acceptable Tolerance is 3 degrees linearity, 5 degrees total

Magnetic Deviation (east is positive) = 10.3

Vane alignment rod (magnetic reading) = 349

Vane alignment rod (true reading) = 359

Sensor Measured Alignment (true) = 358 Logger reading

Alignment Difference (degrees) -1

Note - for fixture tests of combined linearity and orientation, the fixture index direction must be adjusted for:

Data logger offset of -4 degrees plus any alignment difference = -5 degrees

WD Sensor Torque 0.5 mps threshold is 11 gr/cm Found at 6 gr/cm

TEMPERATURE SYSTEM DATA

Standard Reading	2 M Logger Temperature	Difference (degrees)	10 M Logger Temperature	Difference (degrees)	Logger Delta Temperature
0.3	0.10	-0.2	0.12	-0.2	0.03
22.1	22.22	0.1	22.23	0.1	0.01
56.3	56.68	0.4	56.59	0.3	-0.08

Acceptable Tolerance is 0.5C absolute, 0.1C for delta temperature

RELATIVE HUMIDITY SENSOR

Standard (% RH)	Logger (% RH)	Difference (% RH)
9.4	13.7	4.3

For RH the DQO limit is $\pm$ 7%

BAROMETRIC PRESSURE SENSOR

(mm Hg)	(mm Hg)	(mm Hg)
699.6	700	0.4

Acceptable tolerance is 2.3 mm Hg

PRECIPITATION SENSOR

INPUT (inches)	Logger (inches)	Difference (inches)
0.20	0.19	-0.01

Note: Input 100 ml for a target of 0.20 inches (20 tips).
The water must be input over at least 5 minutes.

Comments:

Calibration start 08:05 mst

Calibration end 10:25 mst

Installed a new sensor element for the CS215 Temperature and Relative Humidity Probe.

1.0 INTRODUCTION

The ASARCO Hayden facility is located approximately 80 miles east-southeast of Phoenix and 55 miles north of Tucson, Arizona. ASARCO conducts copper ore processing operations at the facility, including ore crushing, concentrating, and smelting. ASARCO installed a 10 meter meteorological tower near the main Hayden stack in August, 2013, that monitors all AERMOD required parameters. The tower is equipped with an RM Young Wind Monitor AQ wind sensor, RM Young platinum RTD model 43347 ambient temperature sensors at the 2 and 10-meter levels housed in RM Young 43502 motor-aspirated radiation shields, and a Licor model 200 pyranometer that measures solar radiation with a photovoltaic sensor.

The ASARCO meteorological monitoring program has been design to comply with requirements in EPA's "Meteorological Monitoring Guidance for Regulatory Modeling Applications", EPA-454/R-99-005, February 2000 (herein referred to as "EPA's Met Monitoring Guidance"). A Quality Assurance Project Plan (QAPP) has been prepared for the ASARCO Hayden meteorological monitoring program which describes the system design, operational procedures, and Data Quality Objectives (DQOs).

This document is the 10-meter tower data validation report for the period October through December 2020. Section 2 of this report presents a chronology of events that occurred during the reporting period. Section 3 discusses data screening and validation findings, and overall data capture rates. Section 4 summarizes the data collected. Appendix A presents the data screening results. Appendix B presents monthly data plots and data tables for the reporting period.

2.0 CHRONOLOGICAL SUMMARY

There were no significant operational events during the reporting period.

3.0 OPERATION SUMMARY

3.1 10-m Tower Calibrations and Audits

There were no calibrations or audits performed during the reporting quarter.

3.2 Data Validation and Quality Control Screening

Data validation is a process in which suspect data are identified and flagged for additional review and corrective action as necessary. The data validation process provides an additional level of quality assurance for the monitoring program. Some problems that may escape detection during a calibration or audit are often identified during the data validation process. There are various levels of data validation which indicate the level of review and degree of confidence in the data. EPA's Met Monitoring Guidance defines four levels of data validation, and the Project QAPP has directly adopted these validation levels and definitions from EPA as described below:

- Level 0 data validation is essentially raw data obtained directly from the data acquisition systems in the field. Level 0 data have been reduced and possibly reformatted, but are unedited and unreviewed. These data have not received any adjustments for known biases or problems that may have been identified during calibrations or audits. These data can be used to assess the instrument operations on a routine basis, but should not be used for regulatory modeling purposes until they receive Level 1 validation.
- Level 1 data validation involves quantitative and qualitative reviews for accuracy, completeness, and internal consistency. Quantitative checks are performed by software screening programs and qualitative checks are performed by meteorologists or trained personnel who manually review the data for outliers and problems.
- Level 2 data validation involves additional comparisons with other independent data sets.
- Level 3 validation involves a more detailed analysis, when inconsistencies in analysis and modeling results are found to be caused by measurement errors.

As described in the Project QAPP, the data validation process will result in a Level 1 validated meteorological data base of parameters required for regulatory AERMOD modeling analyses. Additional Level 2 comparisons to other data sets are also performed, as well as Level 3 validation as needed.

The data validation process begins with a review of calibration and audit results, followed by quantitative software screening checks and detailed manual review. The meteorological data were screened according to the criteria listed in Appendix C of the Quality Assurance Handbook for Air Measurement Systems (EPA -454/B-08-002 Volume IV). If the comparisons fall outside of typical ranges, the record is flagged for further inspection. Table 1 summarizes the data screening and validation criteria used for the 10 meter meteorological tower parameters.

The ambient temperature, pressure, precipitation, and relative humidity data were then Level 2 screened against monthly maximums, minimums, and averages recorded at the two nearest meteorological monitoring stations from the Arizona Meteorological Network (AZMET), the Safford and Coolidge stations. The period of record for these AZMET stations were from 1987 to 2013. Monthly normal precipitation data from the Globe AZ station reported by Western Regional Climate Center for the period 1975-2008 was also used for comparisons. Larger precipitation events were also Level 2 validated by comparison to concurrent hourly data from the Safford and Coolidge stations. The pressure data was Level 2 validated against one of the PM_{10} Partisol FRM air samplers being operated at ASARCO, the ST-23 sampler (the maximum, average, and minimum hourly pressure differences were -2.5, -3.1, and -4.3 mm Hg over the reporting period, indicating good agreement between the two measurements) . The solar radiation data were Level 2 validated against estimated monthly maximum clear sky radiation values, as determined using the Clear Sky Radiation calculator at http://clearskycalculator.com/pyranometer.htm .

Table 1 - Data Screening and Validation Criteria

Parameter	Data Validation Criteria to Flag Data
Wind Speed	Is less than zero or greater than 25 m/s (56 mph); does not vary by more than 0.1 m/s (0.22 mph) for 3 consecutive hours; does not vary by more than 0.5 m/s (1.1 mph) for 12 consecutive hours; hourly rate of change exceeds 9 m/s (20 mph)
Wind Direction	Is less than zero or greater than 360 degrees; does not vary by more than 1 degree for more than 3 consecutive hours; does not vary by more than 10 degrees for 18 consecutive hours.
2 and 10 meter Ambient Temperature	Is greater than the local record monthly high; is less than the local record monthly low; is greater than a 5C change from the previous hour; does not vary by more than 0.5C for 12 consecutive hours.
10m – 2m Temperature Difference	Is greater than 0.1C/m during the daytime; is less than -0.1C/m during the night time, is greater than 2.0C or less than -2.0C.
Hourly Recorded Solar Radiation	Is greater than zero at night; is more than 5% higher than the maximum theoretical for the month and latitude.
Atmospheric Pressure	Less than 645 mm Hg or greater than 735 mm Hg
Precipitation	Greater than 0.2 inch/hr, less than 0.2 inch/month
Relative Humidity	Greater than 95% and less than 4%

Appendix A presents the results of the computerized screening analyses and data validation reviews. For each data point flagged, the data was manually reviewed and validated using data plots and consistency checking between interrelated parameters to determine if any corrective actions were necessary. The screening summary in Appendix A presents comments from the manual review.

No data edits were required during the data screening and validation process.

In the digital data file that accompanies this data validation report, each hourly data point has been assigned a QC code as listed in Table 8-3 of EPA's Met Monitoring Guidance. The QC codes used were:

Code 0 - valid data,

Code 2 - valid data with corrections (i.e., data with readily identifiable offsets and simple corrections),

Code 7 – suspect data (i.e., lack of calibration documentation, and/or inconsistencies between Level 2 intercomparisons),

Code 8 - invalid data (inconsistent readings between "as-left" and "as-found" calibrations that make developing a correction factor impossible).

Note that all invalid data also has a value of 999.0 in the data file.

3.3 Data Capture Statistics

Based on the data screening and review process, the monitoring data have been validated as Level 1 and data capture statistics have been compiled. Table 2 presents the valid data capture rates for the period. The DQO goals for completeness (i.e., data capture rate) are a minimum of 90% on a quarterly basis. All parameters met these data capture goals for the reporting period.

Table 2 - Data Capture Statistics

Month/Parameter	10m WS	10m WD/ST	Temp/DT	Solar Rad	BaroPress	RelHum	Precip
Jan-20	99.6	99.6	99.6	99.6	99.6	99.6	99.6
Feb-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Mar-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Apr-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0

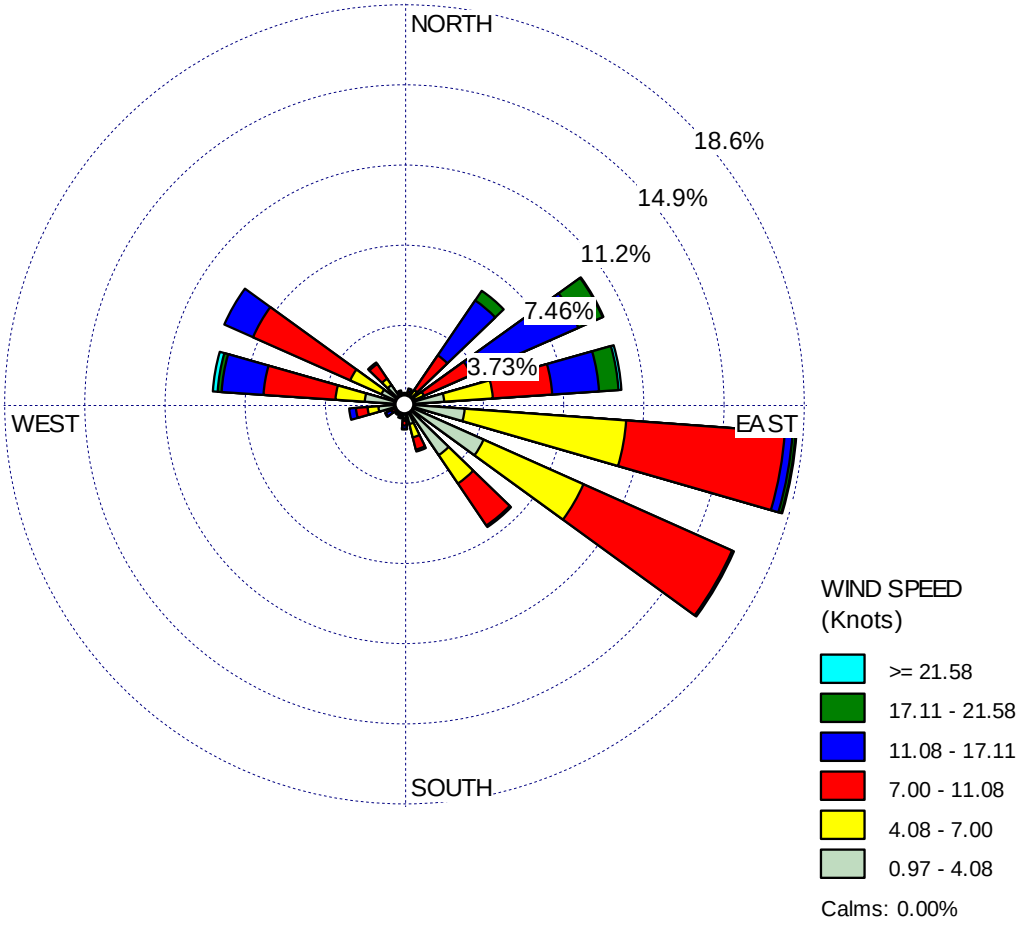
Aug-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Sep-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Oct-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Nov-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Dec-20	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Quarter 1	99.9	99.9	99.9	99.9	99.9	99.9	99.9
Quarter 2	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Quarter 3	99.9	99.9	99.9	99.9	99.9	99.9	99.9
Quarter 4	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Total	99.9	99.9	99.9	99.9	99.9	99.9	99.9



Note: The reported valid data capture rates are the percentage of the possible hours for each month, quarter, and total period.

4.0 DATA RESULTS

Appendix B presents plots of monthly data and monthly data tables for the reporting period.

Figure 1 presents a plot of the quarterly valid 10-meter wind speed and wind direction data in a format called a "wind rose" plot. This wind rose indicates that there are two predominate wind directions at the site; one from the east-southeast (typically occurring in the morning and evening hours), and a second from the west-northwest (typically occurring in the afternoon hours with higher wind speeds). This is similar to wind patterns previously observed at the monitoring site.

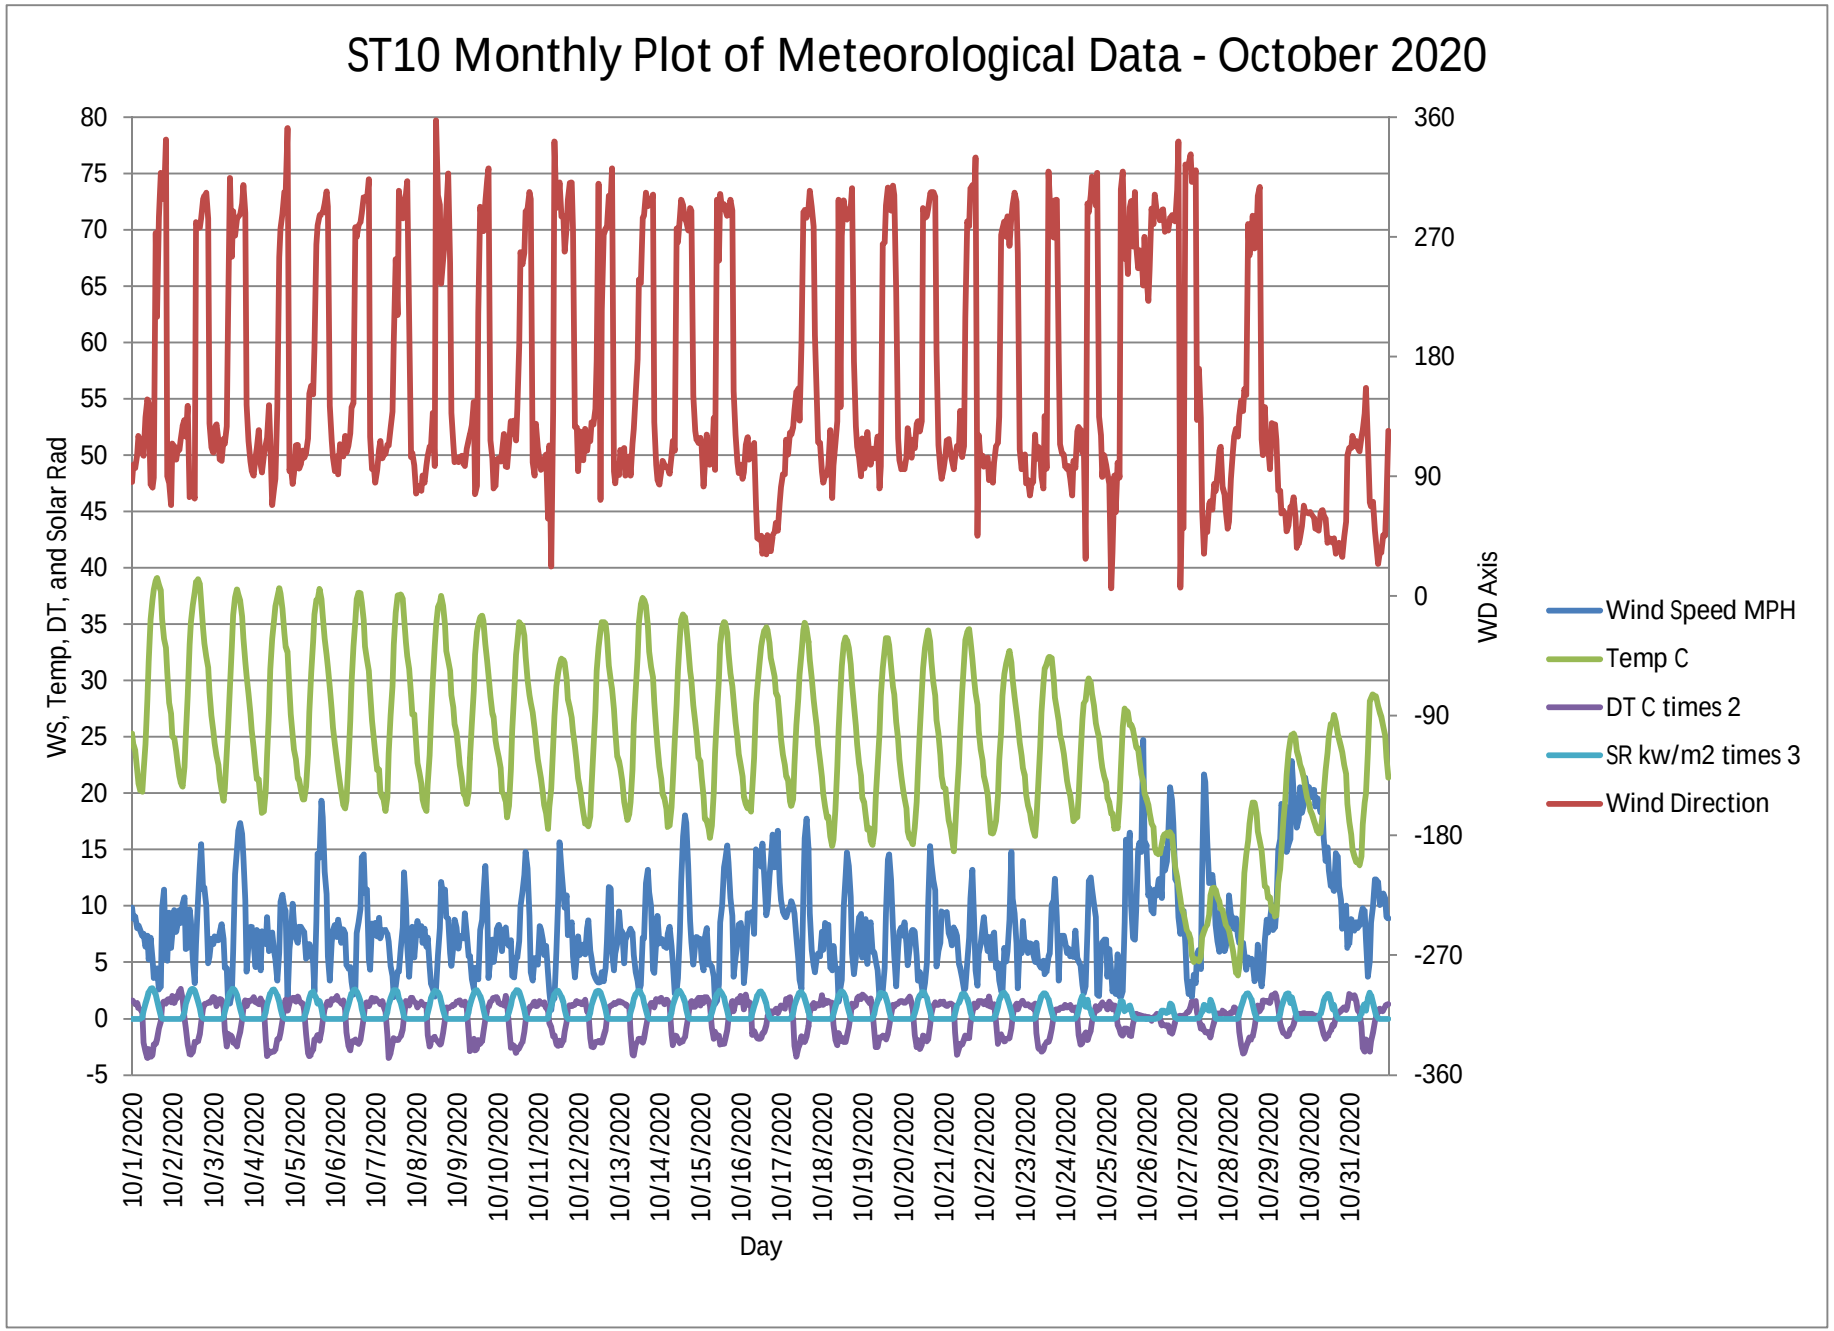
Figure 1 – 10m Wind Rose Plot

Wind directions are the direction the wind is blowing FROM.

APPENDIX A

Data Screening and Validation Results

ASARCO ST-10 10-Meter Data - QA Screen Test Results for October through December 2020 - Note that WS is in m/s, Temp and Delta T are in C, and Solar Rad is in kw/m2
Parameters include Wind Speed and Direction (WS WD), Sigma Theta (ST), Temperature and Delat T (TP and D1) and Solar Radiation (SR)



ITYPE	PARM	DATE	CODE	Value	Comments
4	WS	20100706	WIND SPD TOO CONSTANT 3 HR	0.11	#REF!

WHITE PAPER

DOCUMENTION OF GEP STACK HEIGHT AT ASARCO SMELTER IN HAYDEN, ARIZONA

by
Ron Petersen, PhD, CCM, FASHRAE
CPP, Inc.
2400 Midpoint Drive, Fort Collins, CO, 80525
August 25, 2015

Abstract

In 1983, EPA approved a good engineering practice ("GEP") stack height demonstration for the 1000 foot (305 m) stack at the ASARCO LLC smelter located in Hayden, Arizona based upon a wind tunnel study conducted by Petersen and Cermak (1979). In 1985, EPA revised the GEP stack height regulations that included new definitions for "nearby" terrain and "excessive concentrations." This white paper examines the changes in the 1985 regulations, evaluates the 1979 wind tunnel study results in light of the change in regulations and guidance, and concludes, based on information in the 1979 wind tunnel study and available through current dispersion modeling, that the 1983 GEP stack height determination is consistent with the 1985 regulations and that the 1000 foot (305 m) stack remains an appropriate GEP determination.

Background

Petersen and Cermak (1979) conducted a wind tunnel modeling study to determine whether the 1000 foot (305 m) stack at the ASARCO Hayden smelter is above or below the "good engineering practice" (GEP) stack height established by Congress in Section 123 of the Clean Air Act. The study found that the 1000 foot (305 m) stack is below the GEP stack height and hence, can be used an input for compliance modeling purposes. At the time of the study, the procedures for conducting these wind tunnel modeling studies were in draft form and the 1979 wind tunnel study closely followed the EPA (1979) Draft Guideline.

Based on the results of the 1979 wind tunnel study, EPA proposed that the ASARCO 1000 foot stack be approved as GEP on November 30, 1981 (46 FR 58098-01) after the Arizona Department of Environmental Quality's review and approval in September 1979. EPA then approved the 1000 foot stack as meeting the GEP stack height requirement on January 14, 1983 (48 FR 1717-01). This GEP stack height has been used for all subsequent modeling and compliance purposes through the present date.

This white paper examines the 1979 wind tunnel study that addressed the 1000 foot stack in the context of changes to the GEP regulations in 1985, and demonstrates that the conclusion of that study remains valid today.

Definition of GEP Stack Height According the 1985 Final Rule

In the final (1985) stack height regulation (40 CFR 51.100 (ii)), GEP stack height is defined to be the *greater* of:

"(1) 65 meters, measured from the ground level elevation at the base of the stack;

(2) (i) for stacks in existence on January 12, 1979, and for which the owner or operator had obtained all applicable permits or approvals required under 40 CFR Parts 51 and 52,

$$H_g = 2.5H \quad (1)$$

provided that the owner or operator produces evidence that this equation was actually relied on in establishing an emission limitation:

(ii) for all other stacks,

$$H_g = H + 1.5L \quad (2)$$

where;

H_g = good engineering practice stack height, measured from the ground-level elevation at the base of the stack,

H = height of nearby structure(s) measured from the ground-level elevation at the base of the stack,

L = lesser dimension, height or projected width, of nearby structure(s),

provided that the EPA, State, or local control agency may require the use of a field study or fluid model to verify GEP stack height for the source; or

(3) The height demonstrated by a fluid model or a field study approved by the EPA, State, or local control agency, which ensures that the emissions from a stack do not result in excessive concentrations of any air pollutant as a result of atmospheric downwash, wakes, or eddy effects created by the source itself, nearby structures or nearby terrain features."

The ASARCO Hayden smelter is located in the potential downwash zone of a ridge located to the north and east of the smelter. Based on (3), physical modeling is required to determine the GEP stack height for complex terrain situations, such as for the ASARCO Hayden smelter. The demonstration needs to show that excessive concentrations result due to upwind terrain wakes and eddies based on the definition of nearby terrain and excessive concentration.

For the final rule (FR, Vol. 50, No. 130, July 8, 1985), excessive concentration was defined as follows:

CPP, Incorporated
2400 Midpoint Drive, Unit 190
Fort Collins, Colorado 80524, USA
info@cppwind.com
www.cppwind.com
Tel: +1 970 221 3371
Fax: +1 970 221 3124

> "A maximum concentration due to emissions from a stack due in whole or part to downwash, wakes or eddy effects produced by nearby structures or nearby terrain features which individually is at least 40 percent in excess of the maximum concentration experienced in the absence of such downwash, wakes, or eddy effect and which contributes to a total concentration due to emissions from all sources that is greater than an ambient air quality standard."

For conducting demonstrations under 51.1 (ii) (3) "nearby" means:

> "not greater than 0.8 km (1/2 mile), except that the portion of a terrain feature may be considered to be nearby which falls within a distance of up to 10 times the maximum height (H_t) of the feature, not to exceed 2 miles if such feature achieves a height (H_t) 0.8 km from the stack that is a least 40 percent of the GEP stack height determined by the formula…."

Based on the definition of excessive concentration, the maximum ground-level concentration from wind-tunnel testing with the terrain present is first compared to NAAQS. For this comparison, the background concentration and impact due to other sources must be added to the impact due to the stack being evaluated. If the total concentration is below NAAQS, a shorter stack must be considered. Once a stack height is found such that a lower stack would result in an exceedance of NAAQS, it is considered GEP if the concentration without nearby terrain present is at least 40 percent less than that with the terrain present (referred to as the 40 percent test). Key in the 40 percent excess concentration demonstration is the method used to model the "terrain-out" test configuration.

The following sections will show that the Petersen and Cermak (1979) study, while conducted following a combination of the 1979 EPA Draft Guideline and 1982 GEP stack height rule (FR, Vol 47, No. 26, 1982), provide results that meet the requirements for demonstrating that the 1000 foot stack is GEP according the final rule (EPA, 1985). The main areas to consider are the definition of an excessive concentration and the definition of "nearby" terrain.

Impact of EPA Guideline Changes Regarding the Definition of an Excessive Concentration

Petersen and Cermak (1979) conducted a wind tunnel modeling study that demonstrated that the 1000 foot stack met the excessive concentration requirements due to adverse upwind terrain wake effects as outlined in the EPA Guideline (1979). The excessive concentration requirement in the 1979 EPA Guideline was:

> "Concentrations in the wake of the structure or terrain obstacle are considered excessive if the ground-level concentrations exceed an ambient air quality standard or PSD increment and are at least 40 percent greater than the maximum in the absence of their influences."

This excessive concentration definition is the same as the final 1985 rule definition and both criteria were demonstrated by Petersen and Cermak (1979). Based on that demonstration, EPA approved the 1000 foot stack as GEP and that height was used for all subsequent compliance modeling

CPP, Incorporated

Fax: +1 970 221 3124

studies. That alone should be sufficient justification for allowing the 1000 foot stack to be classified as GEP for future modeling applications.

The EPA 1979 Draft Guideline was finalized in 1981 followed by the first stack height rule that was published in 1982. The 1981 EPA guideline and 1982 rule relaxed the definition of excessive concentration so that only a 40 percent concentration increase due to upwind terrain wake and eddy effects needed to be demonstrated. This change had no effect on the results of the Petersen and Cermak (1979) study.

The conclusion is that the changes to the definition of excessive concentration have no impact on the Petersen and Cermak (1979) study and their determination that the 1000 foot stack is GEP.

Impact of EPA Guideline and Rule Changes Regarding the Definition of Nearby Terrain

The methodology for determining the GEP stack height is to first conduct testing with all relevant upwind and downwind terrain present in the model. The results from this testing are then first used to determine whether a NAAQS exceedance can be demonstrated.

According to EPA (1985), nearby terrain can be considered for determining the GEP stack height with certain constraints. First, for terrain to be considered nearby, the terrain within 0.8 km (0.5 miles) of the stack must rise to at least 40 percent of the formula GEP stack height for the wind directions being evaluated. The formula GEP stack height for the ASARCO Smelter is 65 m which means the terrain must rise by at least 26 m within 0.8 km of the stack. Figure 1 shows that the height of the terrain, H_t, at 0.8 km is 137 m which is well above the 26 m threshold. Hence, the elevation of the nearby terrain is sufficiently high to qualify for a wind tunnel demonstration study and this part of the 1985 “nearby” definition has no impact on the 1979 wind tunnel study results.

The next step for determining the GEP stack height is to conduct testing without the upwind terrain. The maximum concentration from this testing is then compared to the maximum concentration from testing with all terrain present and if the maximum concentration with terrain present is a least 40% greater than that without the upwind terrain present, the stack is creditable as GEP. For this comparison, Petersen and Cermak (1979) removed all of the upwind terrain as illustrated in Figure 2 which was consistent with EPA 1979 and 1981 Guidance and the 1982 rule.

According to the final rule (1985) and EPA Guidance (1985), the amount of terrain that can be considered nearby for fluid modeling purposes extends out to 10 times the maximum height (H_T) of the terrain feature (10 H_T), not to exceed 3.2 km. For this case, the maximum terrain height is 242 m, which means that the maximum distance that can be considered nearby is 2.4 km (242 m * 10). Beyond that distance, the terrain is not nearby and cannot be removed for wind tunnel modeling purposes.

Figure 3 shows the upwind terrain that should be modeled for the “terrain-out” configuration according EPA (1985) guidance. The figure shows that only the nearby terrain is removed while the terrain that is not nearby remains in the model. This configuration is different than the one used by

CPP, Incorporated

Fax: +1 970 221 3124

Petersen and Cermak (1979) where all upwind terrain was removed (Figure 2). If the study had been conducted using EPA (1985) guidance, the concentrations with upwind terrain removed could increase by some factor due to the terrain that remains in the model.

Petersen and Cermak (1979) found that at the 1000 foot stack height the ratio of maximum concentration with and without the upwind terrain present was 1.68 (68% increase due terrain). For that ratio to decrease to 1.4 (40% increase due terrain), the wind tunnel test results for the "terrain-out" configuration using the EPA (1985) procedure would have to increase by 20% or more.

Figure 3 shows that the highest terrain feature remaining for the EPA (1985) "terrain-out" configuration is about 5200 m upwind with a maximum height of 228 m above stack base. A representative hill height is approximately 200 m or less. Thompson and Snyder (1985) found that a source that is 1.5 hill heights tall positioned 20 hill heights downwind of a steep triangular ridge has maximum concentrations with and without the ridge present that are essentially the same (see Figure 4). Since the Main Stack is ~1.5 hill heights tall and is 23 hill heights, or more, downwind of the terrain feature, this research confirms that the EPA (1985) "terrain-out" procedure will have an insignificant impact on the 68% excessive concentration demonstrated by Petersen and Cermak (1979).

In conclusion, the impact of the change in the definition of "nearby" terrain has no impact on the results in Petersen and Cermak (1979) or the 1000 foot GEP stack height determination.

Impact of the New 1-Hr SO_2 NAAQS

At the time the study was carried out, the NAAQS exceedance requirement for an excessive concentration was demonstrated using the 3-hr SO_2 NAAQS of 1300 ug/m^3. In 2010, a new 1-hr SO_2 NAAQS of 75 ppb (196 µg/m^3) was promulgated. Since the new 1-hr NAAQS is lower than the 3-hr NAAQS, an exceedance of the 1-hr NAAQS is also demonstrated based on the emission rate used in Petersen and Cermak (1979).

Existing SO_2 Emission Rates and NAAQS Exceedance

Even though there is no logical reason why ASARCO should continue justifying the GEP stack height based on the NAAQS exceedance criteria as ASARCO continues to reduce emissions, this section will assess whether an 1-hr NAAQS exceedance can be demonstrated using NSPS emission rates for NSPS sources, as set forth in the 1985 rule, and current emission rates for other contributing sources. To make this demonstration, the results of the past study were re-analyzed. Table 1 shows the relevant stack operating parameters that were simulated in the wind tunnel and the existing operating parameters.

The past wind tunnel results were converted to a normalized concentration of the form CU_{ref}/Q which is related to the maximum ground level concentration as follows based on the Gaussian dispersion equation that is used in the AERMOD:

CPP, Incorporated
2400 Midpoint Drive, Unit 190
Fort Collins, Colorado 80524, USA
info@cppwind.com
www.cppwind.com
Tel: +1 970 221 3371
Fax: +1 970 221 3124

$$\frac{CU_{ref}}{Q} = \frac{1}{2\pi\sigma_y\sigma_z}\, exp\left[-0.5\left(\frac{h_p}{\sigma_z}\right)^2\right] x\ 10^6$$

where

C	=	SO_2 concentration (ug/m3),
U_{ref}	=	Reference wind speed (m/s) at the reference height of 585.6 m,
Q	=	SO_2 emission rate (g/s),
σ_y, σ_z	=	Horizontal and vertical dispersion coefficients, and
h_p	=	Plume height above ground level (m).

The equation shows that CU_{ref}/Q will only change with plume height (h_p) for a given meteorological condition (i.e., σ_y and σ_z fixed).

Table 2 shows that the ratio of stack exit velocity to wind speed is about 1.5 (R), or less, for the cases simulated in the wind tunnel and the existing configuration. When R is 1.5 or less, the plume will level off close to stack top for all cases shown in Table 2. With constant plume rise, CU_{ref}/Q is a constant value which is best indicated by the average CU_{ref}/Q over all cases observed in the wind tunnel. The average observed value is provided in Table 2 which was also used for the existing configuration. Next, the 1-hr SO_2 concentration was determined by dividing CU_{ref}/Q by U_{ref} and multiplying by Q.

In addition to the Main Stack there are several other sources of SO_2 emissions at the ASARCO smelter: Converter Aisle fugitives, Flash Furnace fugitives, Anode Furnace fugitives, the Anode Furnace baghouse stack, and Slag Pouring. To obtain the impact from these sources an air dispersion modeling analysis was conducted in a manner very similar to that which is described in the recent Hayden SIP Modeling Report entitled "SO_2 Air Dispersion Modeling Analysis for ASARCO, LLC; Hayden, Arizona" (July 2015). Because these additional sources are not NSPS sources, and therefore do not have an NSPS rate unlike the Main Stack, for the purposes of this analysis nearly all of the emissions modeled were conservatively assumed to be actual emissions (as opposed to allowables).

Key aspects of this analysis are as follows:

- Modeling was conducted using AERMOD
- Meteorological data used were taken from the on-site Camera Hill meteorological station (August 16, 2013 through August 15, 2014)
- Emissions for the scenario were modeled as follows:
    - Flash Furnace fugitives: based on fugitive emissions study (same procedure used for annual emissions inventory)
    - Converter Aisle fugitives: based on fugitive emissions study (same procedure used for annual emissions inventory)

- Anode Furnace fugitives: based on anode furnace baghouse permit revision estimated maximum
- Anode Furnace Baghouse Stack: anode furnace baghouse permit revision allowable rate
- Slag Pouring: maximum hourly emission rate, ratioed by monthly slag pouring

Model receptors were placed at a distance of 2895 m from the Main Stack (the distance at which the maximum Main Stack concentrations were calculated from the Wind Tunnel Study), along and very near the 51 degree radial (i.e., to the southwest of the Main Stack).

Because the maximum Main Stack concentration was calculated for a tower wind speed of 4.3 m/s at a wind direction of 51 degrees, the predicted 1-hr SO_2 concentrations from the other sources were examined to identify those which occurred with both a wind speed and wind direction close to these values. While there were many concentrations predicted to occur under conditions very close to those, the concentration that nearly perfectly matched the meteorological conditions associated with the maximum Main Stack concentration was 28.1 ug/m3, which was predicted to occur with a wind speed of 4.4 m/s and a wind direction of 51 degrees.

Therefore, the total 1-hr SO_2 concentration is the sum of these values:

- 171.8 ug/m3 from the Main Stack,
- 28.1 ug/m3 from other sources at the ASARCO smelter, and
- 6.3 ug/m3 for Background (see Section 5.7 of "SO_2 Air Dispersion Modeling Analysis for ASARCO, LLC; Hayden, Arizona" (July 2015).

The total 1-hr SO_2 concentration for the worst case condition is 206.2 ug/m3, which is greater than the 1-hr SO2 NAAQS of 196 ug/m3.

Table 2 shows the calculated 1-hr SO_2 concentrations and supporting information based on the 1979 wind tunnel study. The above discussion and Table 2 show that even using the NSPS emission rates contemplated under the 1985 rule, an exceedance of NAAQS is demonstrated for the 1000 foot stack under the criteria established by the 1985 rule.

Summary

In summary, the 1000 foot stack at the ASARCO Hayden Smelter is GEP for the following reasons:

- It is the taller of 65 m, the formula height or the height determined through physical modeling as prescribed by the 1985 final stack height rule;
- It was approved by EPA as the GEP stack height in 1983;
- It meets the excessive concentration requirements due to upwind terrain wake effects as defined in EPA (1979, 1981 and 1985) based on NAAQS at the time of the wind tunnel study;
- The EPA (1985) change in the definition of "nearby" and how upwind terrain is modeled has no significant effect on the 40% excess concentration demonstration; and
- An exceedance of the 1-hr SO_2 NAAQS can be demonstrated based on emission rates used in Petersen and Cermak (1979) or using the NSPS rates specified in the 1985 rule.

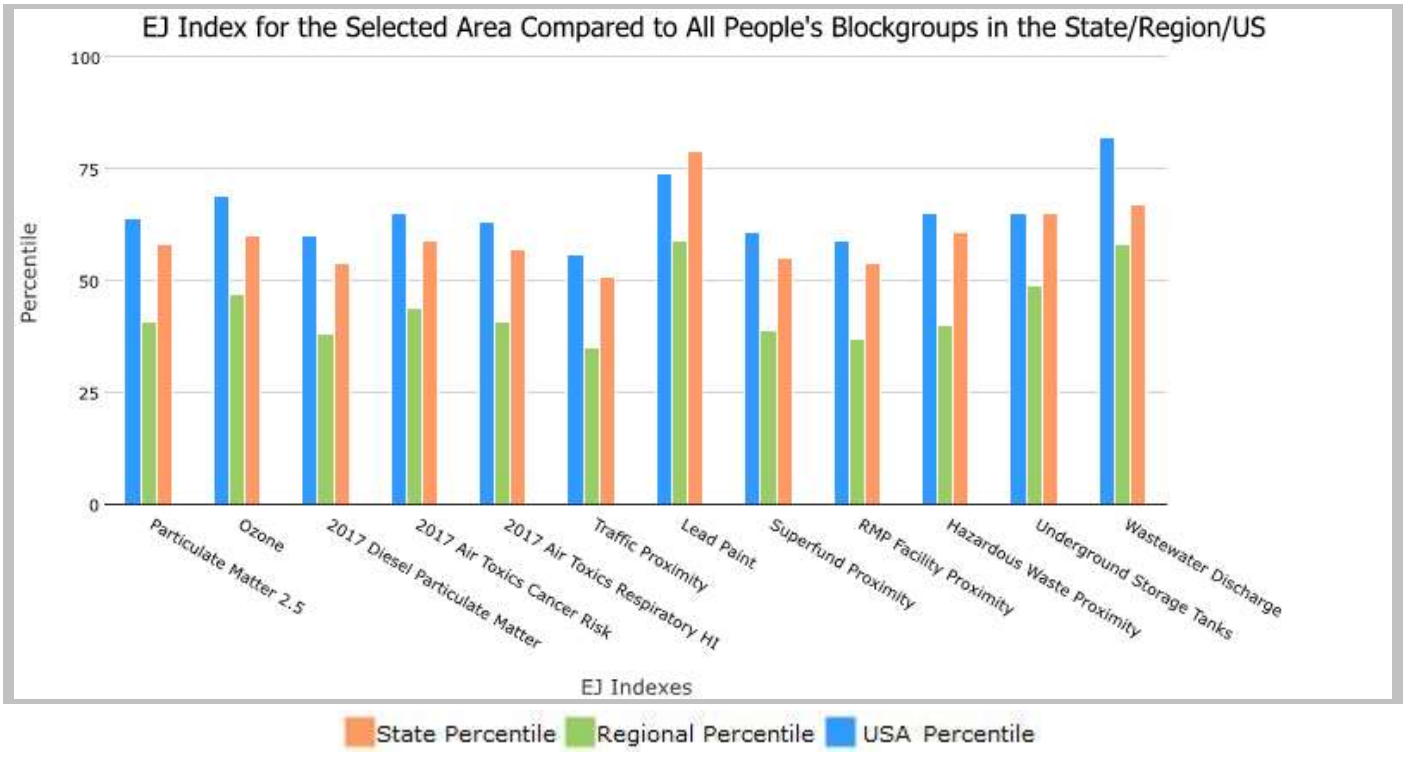
Appendix E
EJScreen Report

Air Quality Division
October 3, 2023 Final Version

This page is intentionally blank.



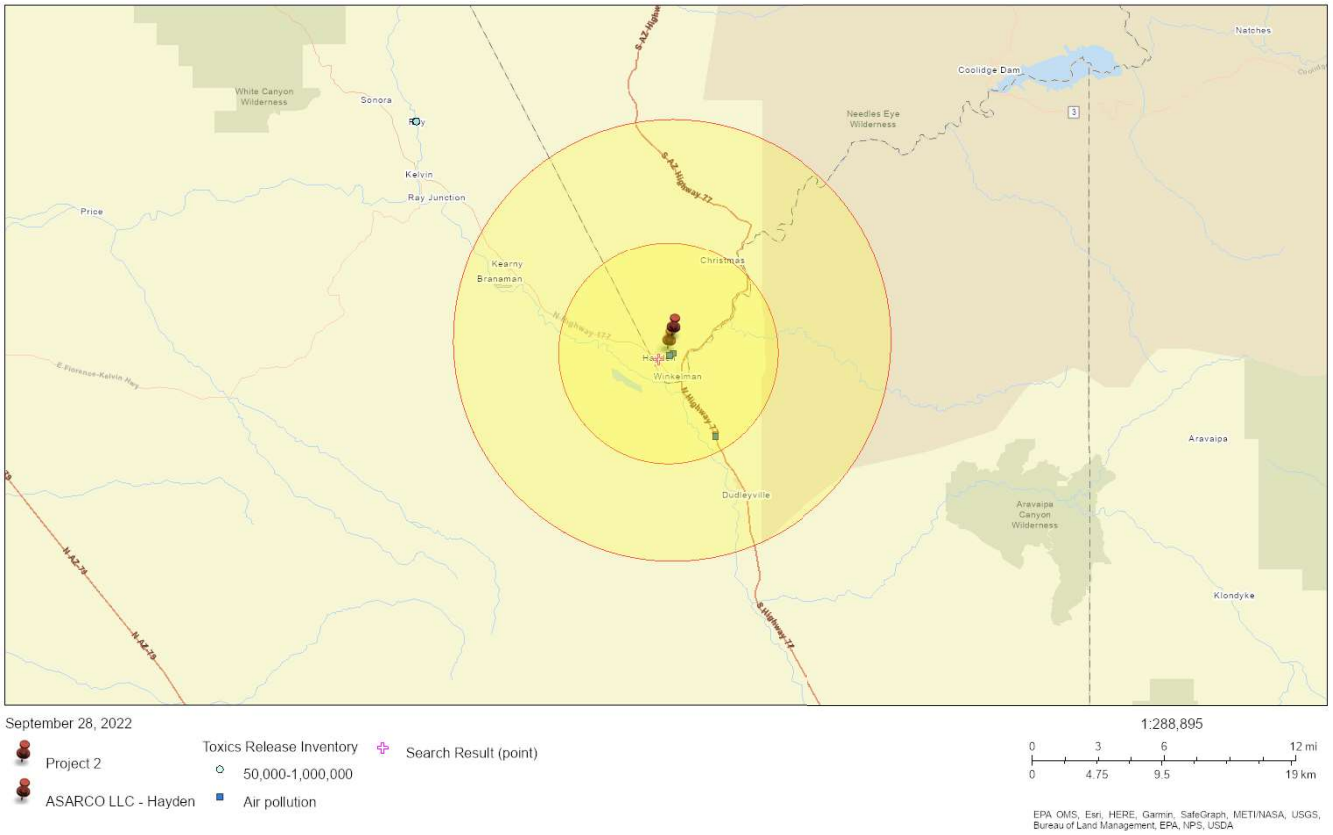
EJScreen Report (Version 2.0)

10 miles Ring Centered at 33.012259,-110.776544, ARIZONA, EPA Region 9

Approximate Population: 4,508

Input Area (sq. miles): 314.03

Selected Variables	State Percentile	EPA Region Percentile	USA Percentile
Environmental Justice Indexes			
EJ Index for Particulate Matter 2.5	58	41	64
EJ Index for Ozone	60	47	69
EJ Index for 2017 Diesel Particulate Matter*	54	38	60
EJ Index for 2017 Air Toxics Cancer Risk*	59	44	65
EJ Index for 2017 Air Toxics Respiratory HI*	57	41	63
EJ Index for Traffic Proximity	51	35	56
EJ Index for Lead Paint	79	59	74
EJ Index for Superfund Proximity	55	39	61
EJ Index for RMP Facility Proximity	54	37	59
EJ Index for Hazardous Waste Proximity	61	40	65
EJ Index for Underground Storage Tanks	65	49	65
EJ Index for Wastewater Discharge	67	58	82



This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

*Diesel particular matter, air toxics cancer risk, and air toxics respiratory hazard index are from the EPA's 2017 Air Toxics Data Update, which is the Agency's ongoing, comprehensive evaluation of air toxics in the United States. This effort aims to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that the air toxics data presented here provide broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. Cancer risks and hazard indices from the Air Toxics Data Update are reported to one significant figure and any additional significant figures here are due to rounding. More information on the Air Toxics Data Update can be found at: https://www.epa.gov/haps/air-toxics-data-update.

For additional information, see: www.epa.gov/environmentaljustice

EJScreen is a screening tool for pre-decisional use only. It can help identify areas that may warrant additional consideration, analysis, or outreach. It does not provide a basis for decision-making, but it may help identify potential areas of EJ concern. Users should keep in mind that screening tools are subject to substantial uncertainty in their demographic and environmental data, particularly when looking at small geographic areas. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJScreen documentation for discussion of these issues before using reports. This screening tool does not provide data on every environmental impact and demographic factor that may be relevant to a particular location. EJScreen outputs should be supplemented with additional information and local knowledge before taking any action to address potential EJ concerns.

ADEQ Arizona Department of Environmental Quality **PUBLIC NOTICE**

ADEQ welcomes comments on the proposal of three actions:

- Revision to the Arizona State Implementation Plan (SIP) for the Hayden Sulfur Dioxide Nonattainment Area for the 1971 and 2010 National Ambient Air Quality Standards (NAAQS).
- Significant Permit Revision to an Air Quality Control Permit to ASARCO LLC for its Hayden Operations facility located in Gila County, Arizona.
- Revised good engineering practice (GEP) demonstration study.

About ADEQ

Under the Environmental Quality Act of 1986, the Arizona State Legislature established the Arizona Department of Environmental Quality in 1987 as the state agency for protecting and enhancing public health and the environment of Arizona. For more information, visit azdeq.gov.

ADEQ will take reasonable measures to provide access to department services to individuals with limited ability to speak, write or understand English and/or to those with disabilities. Requests for language translation, ASL interpretation, CART captioning services or disability accommodations must be made at least 48 hours in advance by contacting the Title VI Nondiscrimination Coordinator, Leonard Drago, at 602-771-2288 or Drago.Leonard@azdeq.gov. For a TTY or other device, Telecommunications Relay Services are available by calling 711.

ADEQ tomará las medidas razonables para proveer acceso a los servicios del departamento a personas con capacidad limitada para hablar, escribir o entender inglés y/o para personas con

discapacidades. Las solicitudes de servicios de traducción de idiomas, interpretación ASL (lengua de signos americano), subtitulado de CART, o adaptaciones por discapacidad deben realizarse con al menos 48 horas de anticipación comunicándose con el Coordinador de Anti-Discriminación del Título VI, Leonard Drago, al 602-771-2288 o Drago.Leonard@azdeq.gov. Para un TTY u otro dispositivo, los servicios de retransmisión de telecomunicaciones están disponible llamando al 711.

GOVDELIVERY

Public Notice

Air Quality

Tuesday, May 16, 2023 - 12:00

On May 16, 2023, the public comment period begins for the proposal of three actions:

- Revision to the Arizona State Implementation Plan (SIP) for the Hayden Sulfur Dioxide Nonattainment Area for the 1971 and 2010 National Ambient Air Quality Standards (NAAQS).
- Significant Permit Revision to an Air Quality Control Permit to ASARCO LLC for its Hayden Operations facility located in Gila County, Arizona.
- Revised good engineering practice (GEP) demonstration study.[1]

The comment period ends June 15, 2023.

Public Notice Information

Permit Revision

Class I Air Quality Permit No. 96410

The facility is subject to the requirements of the Federal Clean Air Act, Code of Federal Regulations, Arizona Revised Statute 49-426, and the Arizona Administrative Code, Title 18, Chapter 2. The facility emits the following air contaminants: coarse particulate matter with diameters 10 micrometers or less (PM_{10}), fine particulate matter with diameters 2.5 micrometers or less ($PM_{2.5}$), volatile organic compounds (VOCs), nitrogen oxides (NO_X), sulfur dioxide (SO_2), carbon monoxide (CO) and hazardous air pollutants (HAPs).

SIP Revision

EPA officially designated the Hayden area as nonattainment on Aug. 5, 2013, for the 2010 NAAQS based on existing monitoring data from 2009-2010. This proposed SIP revision demonstrates that all essential regulatory elements have been met and the Hayden SO_2 Planning Area will attain the 2010 primary SO_2 NAAQS. Additionally, this SIP revision will satisfy any remaining requirements for the 1971 SO2 NAAQS.

GEP Demo Study

In 1983, EPA approved a GEP stack height demonstration for the 1,000-foot (305 m) main stack at the ASARCO - Hayden Smelter located in Hayden, Arizona. At EPA's request in mid-2015 and 2022, the GEP stack height determination was reassessed with respect to the current GEP regulations. This reassessment—included in the proposed SIP revision—confirmed that the original GEP stack height determination is consistent with the 1985 regulations and that the 1,000-foot stack remains an appropriate GEP determination.

Comments may also be offered in-person at a Public Hearing | June 15, 2023, 3 p.m. | View Hearing Information >

People who file comments on the permit will have the right to appeal the final decision as an appealable agency action to the Office of Administrative Hearing (OAH) pursuant to §41.1092.03, and the appeal must be filed within 30 days after the issuance of the final decision. The OAH may sustain, modify or reverse the final decision.

EPA Petition Process

This permit is subject to review by the Environmental Protection Agency (EPA) pursuant to 40 CFR 70.8 and Arizona Administrative Code R18-2-307. If EPA does not object to the issuance of this permit, you may petition to EPA within 60 days after the expiration of EPA's 45-day review period. A petition shall be based only on objections to the permit that were raised with reasonable specificity during the public comment period, unless the petitioner demonstrates that it was impracticable to raise such objections within such period, or unless the grounds for such objection arose after such period. Any person who petitions to EPA pursuant to 40 CFR 70.8(d) shall notify ADEQ by certified mail within 10 days after such petition.

Comments may be submitted to EPA according to the process for Title V Petitions | Learn More >

PUBLIC NOTICE

YOU HAVE A VOICE IN AIR POLLUTION CONTROL IN ARIZONA

The Arizona Department of Environmental Quality (ADEQ) proposes three actions through this public notice. First, ADEQ proposes a revision to the Arizona State Implementation Plan (SIP) for the Hayden Sulfur Dioxide Nonattainment Area for the 1971 and 2010 National Ambient Air Quality Standards (NAAQS), which ADEQ will request the U.S. Environmental Protection Agency (EPA) to approve as a revision to the Arizona SIP. Second, ADEQ proposes Significant Permit Revision Number 96410, revision to Air Quality Control Permit Number 39948, to ASARCO LLC - Hayden Operations for the incorporation of the Uptake Improvement Project, Fuming Ladle Control Project, the Anode Furnaces Secondary Hood Project, and the addition of sulfur dioxide (SO2) emission limitations as part of the SIP for the Hayden SO2 Nonattainment Area at the ASARCO - Hayden Smelter, a copper concentrator and smelter facility located at 100 N. Hayden Ave., Hayden, AZ 85135. Third, ADEQ proposes a revised good engineering practice (GEP) demonstration study pursuant to 40 Code of Federal Regulations (CFR) § 51.118.

The mailing address for the facility is P.O. Box 8, Hayden, AZ 85135. The facility is subject to the requirements of the Federal Clean Air Act, CFR, Arizona Revised Statute (A.R.S.) § 49-426, and the Arizona Administrative Code (A.A.C), Title 18, Chapter 2. The facility emits the following air contaminants: coarse particulate matter with diameters 10 micrometers or less (PM10), fine particulate matter with diameters 2.5 micrometers or less (PM2.5), volatile organic compounds (VOCs), nitrogen oxides (NOX), sulfur dioxide (SO2), carbon monoxide (CO) and hazardous air pollutants (HAPs).

EPA officially designated the Hayden area as nonattainment on August 5, 2013 for the 2010 NAAQS based on existing monitoring data from 2009-2010. This proposed SIP revision demonstrates that all essential regulatory elements have been met and the Hayden SO2 Planning Area will attain the 2010 primary SO2 NAAQS. Additionally, this SIP revision will satisfy any remaining requirements for the 1971 SO2 NAAQS.

In 1983, EPA approved a GEP stack height demonstration for the 1,000-foot (305 m) main stack at the ASARCO - Hayden Smelter located in Hayden, Arizona. At EPA's request in mid-2015 and 2022, the GEP stack height determination was reassessed with respect to the current GEP regulations. This re-assessment—included in the proposed SIP revision—confirmed that the original GEP stack height determination is consistent with the 1985 regulations and that the 1,000-foot stack remains an appropriate GEP determination.

This public notice provides information to help you participate in the decision-making process. You have an opportunity to submit written comments about this permit and SIP revision, and GEP re-assessment. In addition, ADEQ will hold a public hearing on June 15, 2023 at 3:00 PM at Hayden Senior Center, 520 N. Velasco Avenue, Hayden, AZ 85135, where you may comment in person. To submit written comments, include your name, mailing address, signature (and/or your agent or attorney signature) and clearly explain why the permit should or should not be issued. Grounds for comment on the permit are limited to whether the permit meets the criteria for issuance spelled out in the state air pollution control laws or rules.

Affidavit of Publication

Payson Roundup

STATE OF ARIZONA 10112695

COUNTY OF GILA 5/16/2023

I, Ann Fowler, do solemnly swear that I am Assistant Bookkeeper of the Payson Roundup, that the same is a newspaper printed, in whole or in part, and published in the COUNTY OF GILA, State of Arizona, and has a general circulation therein; that said newspaper has been published continuously and uninterruptedly in said COUNTY OF GILA for a period of more than fifty-two weeks prior to the first publication of the annexed legal notice or advertisement; that said newspaper has been admitted to the United States mails as second-class matter under the provisions of the Act of March 3, 1879, or any amendments thereof, and that said newspaper is a newspaper duly qualified for publishing legal notices and advertisements within the meaning of the laws of the State of Arizona. That the annexed legal notice or advertisement was published in the regular and entire issue of every number of said daily newspaper for the period of 2.00 consecutive insertions; and that the first publication of said notice was in the issue of said newspaper dated May 16 A.D., 2023, and that the last publication of said notice was in the issue of said newspaper dated May 23 A.D., 2023. In witness whereof I have hereunto set my hand this May 23 A.D., 2023.

COMMISSION # 646883
MY COMMISSION EXPIRES
MARCH 29, 2027

The public notice period is in effect from May 16, 2023 to June 15, 2023.
Comments regarding the SIP revision and the GEP re-assessment may be submitted in writing to: Zachary Dorn, Air Quality Improvement Planning, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007 or via email to dorn.zachary@azdeq.gov.
Comments regarding the permit revision may be submitted in writing to: Karla Murrieta, Air Permits Unit, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007 or via email to airpermits@azdeq.gov. Comments must be received or postmarked no later than 5:00 PM on June 15, 2023.
The SIP revision, draft permit, GEP re-assessment, and related documentation are available for review online at azdeq.gov/notices by searching for the date of this public notice, or in person at the ADEQ Records Center by scheduling an appointment at least 48 hours in advance. For ADEQ Records Center information, visit azdeq.gov/records-center, call (602) 771-4380 or email recordscenter@azdeq.gov. The documents are also available at the Town of Hayden, Town Clerk's Office located at 520 Velasco Ave, Hayden, AZ 85135.
ADEQ will consider all comments received in making a final decision on the proposed permit, SIP revision, and GEP re-assessment. Everyone commenting will receive notification of the final decision. People who file comments on the permit will have the right to appeal the final decision as an appealable agency action to the Office of Administrative Hearing (OAH) pursuant to A.R.S. § 41.1092.03, and the appeal must be filed within thirty (30) days after the issuance of the final decision. The OAH may sustain, modify, or reverse the final decision.
This permit is subject to review by the EPA pursuant to 40 CFR 70.8 and A.A.C. R18-2-307. If EPA does not object to the issuance of this permit, you may petition to EPA within sixty (60) days after the expiration of EPA's forty-five (45)-day review period. A petition shall be based only on objections to the permit that were raised with reasonable specificity during the public comment period, unless the petitioner demonstrates that it was impracticable to raise such objections within such period, or unless the grounds for such objection arose after such period. Please refer to epa.gov/title-v-operating-permits/title-v-petitions for additional information. Any person who petitions to EPA pursuant to 40 CFR 70.8(d) shall notify ADEQ by certified mail as soon as possible, but in no case more than 10 days following such petition. The notification shall include the grounds for objection and whether such objections were raised during the public comment period.
ADEQ will take reasonable measures to provide access to department services to individuals with limited ability to speak, write or understand English and/or to those with disabilities. Requests for language translation, ASL interpretation, CART captioning services or disability accommodations must be made at least 48 hours in advance by contacting the Title VI Nondiscrimination Coordinator, Leonard Drago, at (602) 771-2288 or Drago.Leonard@azdeq.gov. For a TTY or other device, Telecommunications Relay Services are available by calling 711.
ADEQ tomará las medidas razonables para proveer acceso a los servicios del departamento a personas con capacidad limitada para hablar, escribir o entender inglés y/o para personas con discapacidades. Las solicitudes de servicios de traducción de idiomas, interpret-

Commission Expires May 14, 2026
Commission No. 625109

PUBLIC NOTICE

YOU HAVE A VOICE IN AIR POLLUTION CONTROL IN ARIZONA

The Arizona Department of Environmental Quality (ADEQ) proposes three actions through this public notice. First, ADEQ proposes a revision to the Arizona State Implementation Plan (SIP) for the Hayden Sulfur Dioxide Nonattainment Area for the 1971 and 2010 National Ambient Air Quality Standards (NAAQS), which ADEQ will request the U.S. Environmental Protection Agency (EPA) to approve as a revision to the Arizona SIP. Second, ADEQ proposes Significant Permit Revision Number 96410, revision to Air Quality Control Permit Number 39948, to ASARCO LLC - Hayden Operations for the incorporation of the Uptake Improvement Project, Fuming Ladle Control Project, the Anode Furnaces Secondary Hood Project, and the addition of sulfur dioxide (SO2) emission limitations as part of the SIP for the Hayden SO2 Nonattainment Area at the ASARCO - Hayden Smelter, a copper concentrator and smelter facility located at 100 N. Hayden Ave., Hayden, AZ 85135. Third, ADEQ proposes a revised good engineering practice (GEP) demonstration study pursuant to 40 Code of Federal Regulations (CFR) § 51.118.

The mailing address for the facility is P.O. Box 8, Hayden, AZ 85135. The facility is subject to the requirements of the Federal Clean Air Act, CFR, Arizona Revised Statute (A.R.S.) § 49-426, and the Arizona Administrative Code (A.A.C), Title 18, Chapter 2. The facility emits the following air contaminants: coarse particulate matter with diameters 10 micrometers or less (PM10), fine particulate matter with diameters 2.5 micrometers or less (PM2.5), volatile organic compounds (VOCs), nitrogen oxides (NOX), sulfur dioxide (SO2), carbon monoxide (CO) and hazardous air pollutants (HAPs).

EPA officially designated the Hayden area as nonattainment on August 5, 2013 for the 2010 NAAQS based on existing monitoring data from 2009-2010. This proposed SIP revision demonstrates that all essential regulatory elements have been met and the Hayden SO2 Planning Area will attain the 2010 primary SO2 NAAQS. Additionally, this SIP revision will satisfy any remaining requirements for the 1971 SO2 NAAQS.

In 1983, EPA approved a GEP stack height demonstration for the 1,000-foot (305 m) main stack at the ASARCO - Hayden Smelter located in Hayden, Arizona. At EPA's request in mid-2015 and 2022, the GEP stack height determination was reassessed with respect to the current GEP regulations. This re-assessment—included in the proposed SIP revision—confirmed that the original GEP stack height determination is consistent with the 1985 regulations and that the 1,000-foot stack remains an appropriate GEP determination.

This public notice provides information to help you participate in the decision-making process. You have an opportunity to submit written comments about this permit and SIP revision, and GEP re-assessment. In addition, ADEQ will hold a public hearing on June 15, 2023 at 3:00 PM at Hayden Senior Center, 520 N. Velasco Avenue, Hayden, AZ 85135, where you may comment in person. To submit written comments, include your name, mailing address, signature (and/or your agent or attorney signature) and clearly explain why the permit should or should not be issued. Grounds for comment on the permit are limited to whether the permit meets the criteria for issuance spelled out in the state air pollution control laws or rules. The public notice period is in effect from May 16, 2023 to June 15, 2023.

Comments regarding the SIP revision and the GEP re-assessment may be submitted in writing to: Zachary Dorn, Air Quality Improvement Planning, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007 or via email to dorn.zachary@azdeq.gov. Comments regarding the permit revision may be submitted in writing to: Karla Murrieta, Air Permits Unit, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007 or via email to airpermits@azdeq.gov. Comments must be received or postmarked no later than 5:00 PM on June 15, 2023.

The SIP revision, draft permit, GEP re-assessment, and related documentation are available for review online at azdeq.gov/notices by searching for the date of this public notice, or in person at the ADEQ Records Center by scheduling an appointment at least 48 hours in advance. For ADEQ Records Center information, visit azdeq.gov/records-center, call (602) 771-4380 or email recordscenter@azdeq.gov. The documents are also available at the Town of Hayden, Town Clerk's Office located at 520 Velasco Ave, Hayden, AZ 85135.

ADEQ will consider all comments received in making a final decision on the proposed permit, SIP revision, and GEP re-assessment. Everyone commenting will receive notification of the final decision. People who file comments on the permit will have the right to appeal the final decision as an appealable agency action to the Office of Administrative Hearing (OAH) pursuant to A.R.S. § 41.1092.03, and the appeal must be filed within thirty (30) days after the issuance of the final decision. The OAH may sustain, modify, or reverse the final decision.

This permit is subject to review by the EPA pursuant to 40 CFR 70.8 and A.A.C. R18-2-307. If EPA does not object to the issuance of this permit, you may petition to EPA within sixty (60) days after the expiration of EPA's forty-five (45)-day review period. A petition shall be based only on objections to the permit that were raised with reasonable specificity during the public comment period, unless the petitioner demonstrates that it was impracticable to raise such objections within such period, or unless the grounds for such objection arose after such period. Please refer to epa.gov/title-v-operating-permits/title-v-petitions for additional information. Any person who petitions to EPA pursuant to 40 CFR 70.8(d) shall notify ADEQ by certified mail as soon as possible, but in no case more than 10 days following such petition. The notification shall include the grounds for objection and whether such objections were raised during the public comment period.

ADEQ will take reasonable measures to provide access to department services to individuals with limited ability to speak, write or understand English and/or to those with disabilities. Requests for language translation, ASL interpretation, CART captioning services or disability accommodations must be made at least 48 hours in advance by contacting the Title VI Nondiscrimination Coordinator, Leonard Drago, at (602) 771-2288 or Drago.Leonard@azdeq.gov. For a TTY or other device, Telecommunications Relay Services are available by calling 711.

ADEQ tomará las medidas razonables para proveer acceso a los servicios del departamento a personas con capacidad limitada para hablar, escribir o entender inglés y/o para personas con discapacidades. Las solicitudes de servicios de traducción de idiomas, interpretación ASL (lengua de signos americano), subtitulado de CART, o adaptaciones por discapacidad deben realizarse con al menos 48 horas de anticipación comunicándose con el Coordinador de Anti-Discriminación del Título VI, Leonard Drago, al (602) 771-2288 o Drago.Leonard@azdeq.gov. Para un TTY u otro dispositivo, los servicios de retransmisión de telecomunicaciones están disponible llamando al 711.

State Implementation Plan and Permit Revision, and GEP Demonstration for the Hayden SO2 NAA

Oral Proceeding

Public Hearing Transcript

June 15, 2023

Kelly Poole: Thank you for coming. I now open this hearing on the proposed SIP revision for the Hayden SO2 SIP nonattainment area, title V operating permit revision, and good engineering practice (GEP) demonstration.

This proceeding is being recorded and will be preserved for the record.

Today is June 15, 2023 and the time is 3:13 p.m. This hearing is being held at the Hayden Senior Center, located at 520 Velasco Avenue, Hayden, AZ 85135. My name is Kelly Poole, and I have been appointed by the Director of the Arizona Department of Environmental Quality to preside at this proceeding.

The purpose of this oral proceeding is to provide the public an opportunity to:

Hear a summary of the proposed SIP revision, permit revision, and Good Engineering Practice (GEP) demonstration, ask questions, or provide comments if they chose to do so.

The Department's representative for today's hearing is Mariana Mendez Armendariz, Kamran Khan, and Zachary Dorn of the ADEQ's Air Quality Division.

Public notice of the comment period and hearing was published in the Payson Roundup and Arizona Silver Belt on May 16th and May 23rd, 2023, and May 17th and 24th respectively. Copies of the proposal were made available on ADEQ's website, ADEQ Phoenix Records Center, and the Hayden Senior Center starting May 16, 2023 and will remain available until the close of comment period which is 5pm today.

If you wish to make a verbal comment, please fill out a speaker slip, available at the sign-in table, and give it to a Department representative. You may also submit written comments during today's hearing. Comments regarding the SIP revision and the GEP re-assessment may also be

submitted in writing to: Zachary Dorn, Air Quality Improvement Planning, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007, if anyone wants that address we can help you get that you don't have to remember it, or via email to dorn.zachary@azdeq.gov also we can give you that address as well. Comments regarding the permit revision may be submitted in writing to: Karla Murrieta, Air Permits Unit, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007 or via email to airpermits@azdeq.gov and we can give you those addresses too. Comments must be received or postmarked no later than 5:00 PM on June 15, 2023.

Comments made during the formal comment period are required by law to be considered by the Department when preparing the final submission to the U.S. Environmental Protection Agency. ADEQ will include a responsiveness summary for written and oral comments received during the formal comment period.

The agenda for this hearing is as follows:

First, Zachary will present a brief overview of the proposal regarding the SIP and GEP demonstration. Next Mariana will present a brief overview of the permit revision.

Then I will conduct the oral comment portion. At that time, I will call speakers in the order that the comments were received.

Please be aware that any comments at today's hearing that you want the Department to formally consider must be given either in writing or on the record during this oral proceeding.

At this time, Zachary and Mariana will give a brief overview of the proposal.

_____

Zachary Dorn: Thank you, Kelly.

Hello and thank you for coming. This public hearing is regarding the ADEQ's proposal of three actions. First, ADEQ proposes a revision to the Arizona State Implementation Plan, or SIP, for the Hayden Sulfur Dioxide Nonattainment Area for the 1971 and 2010 National Ambient Air

Quality Standards (NAAQS), which ADEQ will request the U.S. Environmental Protection Agency to approve as a revision to the Arizona SIP. Second, ADEQ proposes Significant Permit Revision Number 96410, revision to Air Quality Control Permit Number 39948, to ASARCO LLC - Hayden Operations for the incorporation of the Uptake Improvement Project, Fuming Ladle Control Project, the Anode Furnaces Secondary Hood Project, and the addition of sulfur dioxide (SO2) emission limitations as part of the SIP for the Hayden SO2 Nonattainment Area at the ASARCO - Hayden Smelter, a copper concentrator and smelter facility located at 100 N. Hayden Ave., Hayden, AZ 85135. Third, ADEQ proposes a revised good engineering practice (GEP) demonstration study pursuant to 40 Code of Federal Regulations (CFR) § 51.118.

On June 22, 2010, EPA replaced the existing annual and 24-hour primary sulfur dioxide NAAQS with a new 1-hour sulfur dioxide standard set at a level of 75 parts per billion (ppb) to better protect public health by reducing public exposure to elevated short-term concentrations of sulfur dioxide.

To bring the area back into attainment and to satisfy CAA requirements, in 2017, ADEQ developed revisions to Arizona's State Implementation Plan for the Hayden SO2 nonattainment area.

However, On November 5, 2020 EPA published a limited approval and limited disapproval of the Hayden Smelter rule A.A.C. R18-2-B1302, submitted to EPA with the ADEQ 2017 SIP. EPA issued its limited disapproval because some rule provisions conflict with the requirements of CAA §§ 110 and 172(c)(6). EPA found:

1)the rule does not contain any numeric emission limits or ongoing monitoring requirements corresponding to the levels of fugitive emissions that were modeled in the 2017 nonattainment SIP;

2) R18-2-B1302(E)(6 [4 revised]) provides an option for alternative sampling points that could undermine the enforceable of the stack emissions limit;

3) R18-2-B1302(E)(6) allows for just under 10% of the total facility SO2 emissions annually to be exempt from continuous emission monitoring system (CEMS) requirement;

4) the rule lacks a method for measuring or calculating emissions from the shutdown ventilation flue, which could compromise the enforceability of the main stack emissions limit;

and 5) the rule lacks a method for calculating hourly SO2 emissions

EPA published its "partial approval and partial disapproval" of the 2017 SIP on November 10, 2020. This final action approved the emissions inventory element under CAA §§ 172(c)(3) and

(4) and affirmed that the State met the new source review requirement for the Hayden SO2 NAA under CAA § 175(c)(5). However, EPA disapproved the attainment demonstration, Reasonably Available Control Measures/Reasonably Available Control Technology, enforceable emissions limitations, reasonable further progress, and contingency measures elements.

The purpose of this SIP revision is to correct these disapproval and to attain the NAAQS, no later than January 31, 2027.

Regarding the GEP demonstration, in 1983, EPA approved a GEP stack height demonstration for the 1,000-foot (305 m) main stack at the ASARCO - Hayden Smelter located in Hayden, Arizona. At EPA's request in mid-2015 and 2022, the GEP stack height determination was reassessed with respect to the current GEP regulations. This re-assessment—included in the proposed SIP revision—confirmed that the original GEP stack height determination is consistent with the 1985 regulations and that the 1,000-foot stack remains an appropriate GEP determination.

I will now pass the presentation to Mariana to provide information regarding the significant permit revision.

* * * * *

Mariana Mendez Armendariz: Thank you Zach, The facility is subject to the requirements of the Federal Clean Air Act, Code of Federal Regulations, Arizona Revised Statute 49-426, and the Arizona Administrative Code, Title 18, Chapter 2. The facility emits the following air contaminants: coarse particulate matter with diameters 10 micrometers or less known as PM10, fine particulate matter with diameters 2.5 micrometers or less known as PM2.5, volatile organic compounds known as VOCs, nitrogen oxides known as NOX, sulfur dioxide known as SO2, carbon monoxide known as CO and hazardous air pollutants known as HAPs.

ADEQ proposes Significant Permit Revision Number 96410, revision to Air Quality Control Permit Number 39948, to ASARCO LLC - Hayden Operations for the incorporation of the Uptake Improvement Project, Fuming Ladle Control Project, the Anode Furnaces Secondary Hood Project, and the addition of sulfur dioxide (SO2) emission limitations as part of the SIP for the Hayden SO2 Nonattainment Area at the ASARCO - Hayden Smelter, a copper concentrator and smelter facility located at 100 N. Hayden Ave., Hayden, AZ 85135.

Kelly Poole: This concludes the overview portion of this proceeding. I now open the oral proceeding to all oral comments.

Seeing no comments. Are you sure? Okay. Seeing no comments this concludes the oral comment portion of this proceeding. If you have not already submitted written comments, you may submit them at this time again the comment period was proposal ends today June 15, 2023 at 5pm. Thank you for attending the time is now 3:23PM. I now close this oral proceeding.

GILA COUNTY
COMMISSION # 546663
MY COMMISSION EXPIRES
MARCH 29, 2027

18860 7/14, 7/21/23 PUBLIC NOTICE YOU HAVE A VOICE IN AIR POLLUTION CONTROL IN ARIZONA

The Arizona Department of Environmental Quality (ADEQ) proposes two actions through this public notice. First, ADEQ proposes to issue Significant Permit Revision Number 96410 to ASARCO LLC - Hayden Operations which will update fugitive roofline monitoring requirements at the ASARCO - Hayden Smelter. Second, the ADEQ proposes to update the Arizona State Implementation Plan (SIP) for the Hayden Sulfur Dioxide Nonattainment Area for the 1971 and 2010 National Ambient Air Quality Standards (NAAQS) to incorporate the changes to Significant Permit Revision Number 96410.

On May 16, 2023, ADEQ commenced a public comment period on Significant Permit Revision Number 96410, a State Implementation Plan revision for the 1971 and 2010 sulfur dioxide national ambient air quality standard, and a Good Engineering Practice demonstration. ADEQ held a public hearing on June 15, 2023, and received a comment requesting that the permit Condition III.C.2 of Attachment "I" be changed from specifying a Relative Accuracy Test Audit (RATA) to a Cylinder Gas Audit (CGA). ADEQ is only accepting comments on the proposed change from RATA to CGA for fugitive roofline monitoring requirements in the permit condition referenced above and as part of the SIP revision.

The copper concentrator and smelter facility is located at 100 N. Hayden Ave., Hayden, AZ 85135. The mailing address for the facility is P.O. Box 8, Hayden, AZ 85135. The facility is subject to the requirements of the Federal Clean Air Act, Code of Federal Regulations (CFR), Arizona Revised Statutes (A.R.S.) § 49-426, and the Arizona Administrative Code (A.A.C.), Title 18, Chapter 2. The facility emits the following air contaminants: coarse particulate matter with diameters 10 micrometers or less (PM10), fine particulate matter with diameters 2.5 micrometers or less (PM2.5), volatile organic compounds (VOCs), nitrogen oxides (NOX), sulfur dioxide (SO2), carbon monoxide (CO) and hazardous air pollutants (HAPs).

This public notice provides information to help you participate in the decision-making process. You have an opportunity to submit written comments about this permit. In addition, ADEQ will hold a virtual public hearing via GoToWebinar on August 14, 2023 at 2:00 PM. To submit written comments, include your name, mailing address, signature (and/or your agent or attorney signature) and clearly explain why the permit should or should not be issued. Grounds for comment are limited to whether the permit meets the criteria for issuance spelled out in the state air pollution control laws or rules. The public notice period is in effect from July 14, 2023 to August 14, 2023. Comments regarding the SIP revision may be submitted in writing to: Zachary Dorn, Air Quality Improvement Planning, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007 or via email to dorn.zachary@azdeq.gov. Comments regarding the permit revision may be submitted in writing to: Karla Murrieta, Air Permits Unit, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007 or via email to airpermits@azdeq.gov. Comments must be received by August 14, 2023.

If you wish to verbally comment on this permit, you may join the virtual public hearing using a computer, tablet or phone that is equipped to meet internet and system requirements. You must register to attend it by using the following registration link:

If you do not wish to verbally comment on this permit, we strongly encourage you to listen in by calling (914) 614-3221, and entering webinar code 610-049-524.
The draft permit, SIP revision, and related documentation are available for review online at azdeq.gov/notices by searching for the date of this public notice, or in person at the ADEQ Records Center by scheduling an appointment at least 48 hours in advance. For ADEQ Records Center information, visit azdeq.gov/records-center, call (602) 771-4380 or email recordscenter@azdeq.gov. The documents are also available at the Town of Hayden, Town Clerk's Office located at 520 N. Velasco Ave., Hayden, AZ 85135.
ADEQ will consider all comments received in making a final decision on the proposed permit. Everyone commenting will receive notification of the final decision. People who file comments on the permit will have the right to appeal the final decision as an appealable agency action to the Office of Administrative Hearing (OAH) pursuant to A.R.S. § 41.1092.03, and the appeal must be filed within thirty (30) days after the issuance of the final decision. The OAH may sustain, modify, or reverse the final decision.
This permit is subject to review by the Environmental Protection Agency (EPA) pursuant to 40 CFR 70.8 and A.A.C. R18-2-307. If EPA does not object to the issuance of this permit, you may petition to EPA within sixty (60) days after the expiration of EPA's forty-five (45)-day review period. A petition shall be based only on objections to the permit that were raised with reasonable specificity during the public comment period, unless the petitioner demonstrates that it was impracticable to raise such objections within such period, or unless the grounds for such objection arose after such period. Please refer to epa.gov/title-v-operating-permits/title-v-petitions for additional information. Any person who petitions to EPA pursuant to 40 CFR 70.8(d) shall notify ADEQ by certified mail as soon as possible, but in no case more than 10 days following such petition. The notification shall include the grounds for objection and whether such objections were raised during the public comment period.
ADEQ will take reasonable measures to provide access to department services to individuals with limited ability to speak, write or understand English and/or to those with disabilities. Requests for language translation, ASL interpretation, CART captioning services or disability accommodations must be made at least 48 hours in advance by contacting the Title VI Nondiscrimination Coordinator, Leonard Drago, at (602) 771-2288 or Drago.Leonard@azdeq.gov. For a TTY or other device, Telecommunications Relay Services are available by calling 711.
ADEQ tomará las medidas razonables para proveer acceso a los servicios del departamento a personas con capacidad limitada para hablar, escribir o entender inglés y/o para personas con discapacidades. Las solicitudes de servicios de traducción de idiomas, interpretación ASL (lengua de signos americano), subtitulado de CART, o adaptaciones por discapacidad deben realizarse con al menos 48 horas de anticipación comunicándose con el Coordinador de Anti-Discriminación del Título VI, Leonard Drago, al (602) 771-2288 o Drago.Leonard@azdeq.gov. PUBLIC NOTICE
YOU HAVE A VOICE IN AIR POLLUTION CONTROL IN ARIZONA

The Arizona Department of Environmental Quality (ADEQ) proposes two actions through this public notice. First, ADEQ proposes to issue Significant Permit Revision Number 96410 to ASARCO LLC - Hayden Operations which will update fugitive roofline monitoring requirements at the ASARCO - Hayden Smelter. Second, the ADEQ proposes to update the Arizona State Implementation Plan (SIP) for the Hayden Sulfur Dioxide Nonattainment Area for the 1971 and 2010 National Ambient Air Quality Standards (NAAQS) to incorporate the changes to Significant Permit Revision Number 96410.

On May 16, 2023, ADEQ commenced a public comment period on Significant Permit Revision Number 96410, a State Implementation Plan revision for the 1971 and 2010 sulfur dioxide national ambient air quality standard, and a Good Engineering Practice demonstration. ADEQ held a public hearing on June 15, 2023, and received a comment requesting that the permit Condition III.C.2 of Attachment "I" be changed from specifying a Relative Accuracy Test Audit (RATA) to a Cylinder Gas Audit (CGA). ADEQ is only accepting comments on the proposed change from RATA to CGA for fugitive roofline monitoring requirements in the permit condition referenced above and as part of the SIP revision.

The copper concentrator and smelter facility is located at 100 N. Hayden Ave., Hayden, AZ 85135. The mailing address for the facility is P.O. Box 8, Hayden, AZ 85135. The facility is subject to the requirements of the Federal Clean Air Act, Code of Federal Regulations (CFR), Arizona Revised Statutes (A.R.S.) § 49-426, and the Arizona Administrative Code (A.A.C.), Title 18, Chapter 2. The facility emits the following air contaminants: coarse particulate matter with diameters 10 micrometers or less (PM10), fine particulate matter with diameters 2.5 micrometers or less (PM2.5), volatile organic compounds (VOCs), nitrogen oxides (NOX), sulfur dioxide (SO2), carbon monoxide (CO) and hazardous air pollutants (HAPs).

This public notice provides information to help you participate in the decision-making process. You have an opportunity to submit written comments about this permit. In addition, ADEQ will hold a virtual public hearing via GoToWebinar on August 14, 2023 at 2:00 PM. To submit written comments, include your name, mailing address, signature (and/or your agent or attorney signature) and clearly explain why the permit should or should not be issued. Grounds for comment are limited to whether the permit meets the criteria for issuance spelled out in the state air pollution control laws or rules. The public notice period is in effect from July 14, 2023 to August 14, 2023. Comments regarding the SIP revision may be submitted in writing to: Zachary Dorn, Air Quality Improvement Planning, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007 or via email to dorn.zachary@azdeq.gov. Comments regarding the permit revision may be submitted in writing to: Karla Murrieta, Air Permits Unit, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007 or via email to airpermits@azdeq.gov. Comments must be received by August 14, 2023.

If you wish to verbally comment on this permit, you may join the virtual public hearing using a computer, tablet or phone that is equipped to meet internet and system requirements. You must register to attend it by using the following registration link: https://attendee.gotowebinar.com/register/5019405153517343584. After registering, you will receive a confirmation email containing information about joining the webinar. If you do not wish to verbally comment on this permit, we strongly encourage you to listen in by calling (914) 614-3221, and entering webinar code 610-049-524.

The draft permit, SIP revision, and related documentation are available for review online at azdeq.gov/notices by searching for the date of this public notice, or in person at the ADEQ Records Center by scheduling an appointment at least 48 hours in advance. For ADEQ Records Center information, visit azdeq.gov/records-center, call (602) 771-4380 or email recordscenter@azdeq.gov. The documents are also available at the Town of Hayden, Town Clerk's Office located at 520 N. Velasco Ave., Hayden, AZ 85135.

ADEQ will consider all comments received in making a final decision on the proposed permit. Everyone commenting will receive notification of the final decision. People who file comments on the permit will have the right to appeal the final decision as an appealable agency action to the Office of Administrative Hearing (OAH) pursuant to A.R.S. § 41.1092.03, and the appeal must be filed within thirty (30) days after the issuance of the final decision. The OAH may sustain, modify, or reverse the final decision.

This permit is subject to review by the Environmental Protection Agency (EPA) pursuant to 40 CFR 70.8 and A.A.C. R18-2-307. If EPA does not object to the issuance of this permit, you may petition to EPA within sixty (60) days after the expiration of EPA's forty-five (45)-day review period. A petition shall be based only on objections to the permit that were raised with reasonable specificity during the public comment period, unless the petitioner demonstrates that it was impracticable to raise such objections within such period, or unless the grounds for such objection arose after such period. Please refer to epa.gov/title-v-operating-permits/title-v-petitions for additional information. Any person who petitions to EPA pursuant to 40 CFR 70.8(d) shall notify ADEQ by certified mail as soon as possible, but in no case more than 10 days following such petition. The notification shall include the grounds for objection and whether such objections were raised during the public comment period.

ADEQ will take reasonable measures to provide access to department services to individuals with limited ability to speak, write or understand English and/or to those with disabilities. Requests for language translation, ASL interpretation, CART captioning services or disability accommodations must be made at least 48 hours in advance by contacting the Title VI Nondiscrimination Coordinator, Leonard Drago, at (602) 771-2288 or Drago.Leonard@azdeq.gov. For a TTY or other device, Telecommunications Relay Services are available by calling 711.

ADEQ tomará las medidas razonables para proveer acceso a los servicios del departamento a personas con capacidad limitada para hablar, escribir o entender inglés y/o para personas con discapacidades. Las solicitudes de servicios de traducción de idiomas, interpretación ASL (lengua de signos americano), subtitulado de CART, o adaptaciones por discapacidad deben realizarse con al menos 48 horas de anticipación comunicándose con el Coordinador de Anti-Discriminación del Título VI, Leonard Drago, al (602) 771-2288 o Drago.Leonard@azdeq.gov. Para un TTY u otro dispositivo, los servicios de retransmisión de telecomunicaciones están disponible llamando al 711.

State Implementation Plan and Permit Revision, and GEP Demonstration for the Hayden SO2 NAA

Oral Proceeding

Public Hearing Transcript

August 14, 2023

Laura Mirtich. Good afternoon, everyone. Thank you for coming. I now open this hearing on the proposed SIP revision for the Hayden SO2 SIP nonattainment area, title V operating permit revision, and good engineering practice (GEP) demonstration.

This proceeding is being recorded and will be preserved for the record.

Today is August 14, 2023 and the time is 2:01 p.m. This hearing is being held virtually using GoToWebinar software. My name is Laura Mirtch, and I have been appointed by the Director of the Arizona Department of Environmental Quality to preside at this proceeding.

The purpose of this oral proceeding is to provide the public an opportunity to:

Hear a summary of the proposed SIP revision, permit revision, and GEP demonstration, ask questions, or provide comments if they chose to do so.

The Department's representatives for today's hearing are Mariana Mendez Armendariz and Zachary Dorn of the ADEQ's Air Quality Division.

Public notice of the comment period and hearing was published in the Payson Roundup and Arizona Silver Belt on July 14th and July 21st, 2023, and July 19th and 26th respectively. Copies of the proposal were made available on ADEQ's website, ADEQ Phoenix Records Center, and the Hayden Senior Center starting July 14, 2023 and will remain available until the close of comment period. The comment period was set to end at 5:00 PM today. However, due to technical difficulties with the ADEQ website, ADEQ intends to extend the comment period. ADEQ will announce the close of the comment period in a subsequent notice.

If you wish to make a verbal comment, please raise your hand using the GoToWebinar Software and you will be called on during this proceeding. You may also submit written comments during

today's hearing. Comments regarding the SIP revision and the GEP re-assessment may also be submitted in writing to: Zachary Dorn, Air Quality Improvement Planning, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007 or via email to dorn.zachary@azdeq.gov. Comments regarding the permit revision may be submitted in writing to: Karla Murrieta, Air Permits Unit, ADEQ, 1110 W. Washington St., 3415A-1, Phoenix, AZ 85007 or via email to airpermits@azdeq.gov. Comments must be received or postmarked no later than 5:00 PM on August 14, 2023.

Comments made during the formal comment period are required by law to be considered by the Department when preparing the final submission to the U.S. Environmental Protection Agency. ADEQ will include a responsiveness summary for written and oral comments received during the formal comment period.

The agenda for this hearing is as follows:

First, Zachary will present a brief overview of the proposal regarding the SIP and GEP demonstration. Next Mariana will present a brief overview of the permit revision.

Then I will conduct the oral comment portion. At that time, I will call speakers in the order that hands raised or comments were received.

Please be aware that any comments at today's hearing that you want the Department to formally consider must be given either in writing or on the record during this oral proceeding.

At this time, Zachary and Mariana will give a brief overview of the proposal.

_____

Zachary Dorn: Thank you, Laura.

Hello and thank you for coming. This public hearing is regarding the ADEQ's proposal of three actions. First, ADEQ proposes a revision to the Arizona State Implementation Plan, or SIP, for the Hayden Sulfur Dioxide Nonattainment Area for the 1971 and 2010 National Ambient Air

Quality Standards (NAAQS), which ADEQ will request the U.S. Environmental Protection Agency to approve as a revision to the Arizona SIP. Second, ADEQ proposes Significant Permit Revision Number 96410, revision to Air Quality Control Permit Number 39948, to ASARCO LLC - Hayden Operations for the incorporation of the Uptake Improvement Project, Fuming Ladle Control Project, the Anode Furnaces Secondary Hood Project, and the addition of sulfur dioxide (SO2) emission limitations as part of the SIP for the Hayden SO2 Nonattainment Area at the ASARCO - Hayden Smelter, a copper concentrator and smelter facility located at 100 N. Hayden Ave., Hayden, AZ 85135. Third, ADEQ proposes a revised good engineering practice (GEP) demonstration study pursuant to 40 Code of Federal Regulations (CFR) § 51.118.

On June 22, 2010, EPA replaced the existing annual and 24-hour primary sulfur dioxide NAAQS with a new 1-hour sulfur dioxide standard set at a level of 75 parts per billion (ppb) to better protect public health by reducing public exposure to elevated short-term concentrations of sulfur dioxide.

To bring the area back into attainment and to satisfy CAA requirements, in 2017, ADEQ developed revisions to Arizona's State Implementation Plan for the Hayden Sulfur Dioxide nonattainment area.

However, On November 5, 2020 EPA published a limited approval and limited disapproval of the Hayden Smelter rule A.A.C. R18-2-B1302, submitted to EPA with the ADEQ 2017 SIP. EPA issued its limited disapproval because some rule provisions conflict with the requirements of CAA §§ 110 and 172(c)(6). EPA found:

1)the rule does not contain any numeric emission limitations and emission limits or ongoing monitoring requirements corresponding to the levels of fugitive emissions that were modeled in the 2017 nonattainment SIP;

2) R18-2-B1302(E)(4) provides an option for alternative sampling points that could undermine the enforceable of the stack emissions limit;

3) R18-2-B1302(E)(6) allows for just under 10% of the total facility SO2 emissions annually to be exempt from continuous emission monitoring system (CEMS) requirement;

4) the rule lacks a method for measuring or calculating emissions from the shutdown ventilation flue, which could compromise the enforceability of the main stack emissions limit;

and 5) the rule lacks a method for calculating hourly SO2 emissions

EPA published its "partial approval and partial disapproval" of the 2017 SIP on November 10, 2020. This final action approved the emissions inventory element under CAA §§ 172(c)(3) and

(4) and affirmed that the State met the new source review requirement for the Hayden SO2 NAA under CAA § 175(c)(5). However, EPA disapproved the attainment demonstration, Reasonably Available Control Measures/Reasonably Available Control Technology, enforceable emissions limitations, reasonable further progress, and contingency measures elements.

The purpose of this SIP revision is to correct these disapproval and to attain the NAAQS, no later than January 31, 2027.

Regarding the GEP demonstration, in 1983, EPA approved a GEP stack height demonstration for the 1,000-foot (305 m) main stack at the ASARCO - Hayden Smelter located in Hayden, Arizona. At EPA's request in mid-2015 and 2022, the GEP stack height determination was reassessed with respect to the current GEP regulations. This re-assessment—included in the proposed SIP revision—confirmed that the original GEP stack height determination is consistent with the 1985 regulations and that the 1,000-foot stack remains an appropriate GEP determination.

ADEQ previously noticed this SIP revision, permit revision and GEP demonstration in the Payson Roundup and Arizona Silver Belt on May 16th and May 23rd, 2023, and May 17th and 24th, 2023. On June 15, 2023, ADEQ held a public hearing in Hayden, AZ. During the public hearing and comment period, ADEQ received a comment requesting a change on permit Condition III.C.2 of Attachment "I" from specifying a Relative Accuracy Test Audit (RATA) to a Cylinder Gas Audit (CGA). During this comment period, ADEQ is only accepting comments on the proposed change from RATA to CGA for fugitive roofline monitoring requirements in the permit condition and as part of the SIP revision.

I will now pass the presentation to Mariana to provide information regarding the significant permit revision.

* * * * *

Mariana Mendez Armendariz: Thank you Zach, The facility is subject to the requirements of the Federal Clean Air Act, Code of Federal Regulations, Arizona Revised Statute 49-426, and the Arizona Administrative Code, Title 18, Chapter 2. The facility emits the following air contaminants: coarse particulate matter with diameters 10 micrometers or less (PM10), fine particulate matter with diameters 2.5 micrometers or less (PM2.5), volatile organic compounds (VOCs), nitrogen oxides (NOX), sulfur dioxide (SO2), carbon monoxide (CO) and hazardous air pollutants (HAPs).

ADEQ proposes Significant Permit Revision Number 96410, revision to Air Quality Control Permit Number 39948, to ASARCO LLC - Hayden Operations for the incorporation of the Uptake Improvement Project, Fuming Ladle Control Project, the Anode Furnaces Secondary Hood Project, and the addition of sulfur dioxide (SO2) emission limitations as part of the SIP for the Hayden SO2 Nonattainment Area at the ASARCO - Hayden Smelter, a copper concentrator and smelter facility located at 100 N. Hayden Ave., Hayden, AZ 85135.

* * * * *

Laura Mirtich: This concludes the overview portion of this proceeding.

* * * * *

Laura Mirtich: I now open this proceeding for oral comments.

If you wish to ask a question or make a comment, please press the raise hand icon in the toolbar. We will call on any raised hands during and unmute your line. Alternatively, you can type your comment into the chat.

[45 seconds later]

Laura Mirtich: All right, Wayne Leipold you've been unmuted from our rend so you should be able to turn on your microphone and speak.

Wayne Leipold: I have a question. Since all the smelter has shut down what portion of the requirements for those projects in the facility be expiring current permit, it's being now revised to extend it out five more years. What portion of that has been actually been completed prior to the shutdown?

Wayne: Hello?

Zachary Dorn: Hi just a second. I'm afraid I didn't quite follow the question. Could you repeat it one more time for us?

Wayne Leipold: yeah, I.. seing how the smelter shut down. Oh, wondering what portion of the modifications that were in the old permit actually took place and how they're addressed in the new permit?

Zach: Oh I think I understand the question now. Off the top of my head, I think we'll have to go back and follow up with you later as to what portion of the prior work has already been completed. Because I don't think we have that information on hand at the moment. But with regard to this permit revision it is just with regard to adding the conditions that we discussed here today.

Laura Mirtich: Are there any further questions?

Alright, seeing no comments.

This concludes the oral comment portion of this proceeding.

* * * * *

Laura: If you have not already submitted written comments, you may submit them at this time. Again, ADEQ intends to extend the comment period for this proposal in a subsequent notice.

Thank you for attending.

The time is now 2:15. PM. I now close this oral proceeding.

III. Revisions 7
2 Compilation of Public Comments 9

I. Background

This document contains the Arizona Department of Environmental Quality's (ADEQ or "Department") responses to all significant public comments received on ADEQ's proposed SIP Revision: 2023 Hayden Sulfur Dioxide Nonattainment Area for the 1971 and 2010 SO_2 NAAQS. ADEQ held two oral comment proceedings for this SIP revision. The first was held on June 15, 2023 at the Hayden Senior Center, 520 Velasco Avenue, Hayden AZ 85135. The second was held virtually using Go-To-Webinar Software. ADEQ received comments from Asarco, LLC on June 15, 2023 and one verbal question during its August 14, 2023 public hearing.

II. Comments and Questions

To provide context and clarity, ADEQ included direct quotes of Asarco's comments extracted from the original letter. The Department's response to each comment is directly below each comment. ADEQ notes the page numbers referenced in Asarco's comment letter correspond to the numbering of the pdf file, and not the SIP revision's page numbers.

A. Comments

Comment 1: On page 12, second to last line, it should state that "In 2015, the Hayden smelter produced approximately 350 to 400 million pounds of copper annually." On page 13, the Hayden smelter is limited by its air permit to smelting 693,500 tons concentrate/year and not the 720,000 tons/year stated. On page 22, the current Hayden Title V permit also lists NESHAP Subpart EEEEEE as applicable until such time as ASARCO elects treatment as a major source of HAPs and so the table header should state "NESHAP Subpart QQQ/EEEEEE - NESHAPS for Primary Copper Smelting" instead of just Subpart QQQ.

ADEQ Response: ADEQ agrees with the comment and has made the appropriate changes.

Comment 2: On page 48, in section 4.1.5 Peirce-Smith Converters, third paragraph, when secondary hood gases are routed to the secondary hood baghouse they are treated by high surface area lime injection for SO2 control. On page 49, in section 4.1.6, final paragraph, ASARCO believes that the final sentence should read "The baghouse initially exhausted through a dedicated stack, however, the post-CRP configuration routes the exhaust to the 1,000-foot stack center."

ADEQ Response: ADEQ agrees with the comment and has made the appropriate changes.

Comment 3: On page 58, in section 4.4.1, the "anode furnace baghouse stack" no longer exists after the Converter Retrofit Project. It was rerouted to the main stack center as shown in the diagram immediately above the section. Under *Main Stack,* it may be appropriate to add a second sentence stating that "Treated emissions from the acid plant are exhausted through the main stack center." ASARCO recommends deleting the "(new)"

before vent gas baghouse and changing "were vented to the annulus" to "are vented to the main stack annulus."

ADEQ Response: ADEQ agrees with these comments and has made the appropriate changes.

Comment 4: On page 66, ASARCO recommends revising the first full paragraph as follows to describe the control strategy more clearly:

The emission limitation for the Hayden Smelter is a combination of SO2 emissions from the acid plant tail gas stack, secondary and tertiary converter ventilation gases, ~~and the (new)~~ vent gas baghouse (flash furnace matte tapping, slag skimming, and concentrate dryers), and anode primary baghouse. Under A.A.C. R18-2-B1302(C)(l), the emissions limit from the main stack shallnot exceed 1069.1 pounds per hour on a 14-operating day average basis unless 1518 pounds or less is emitted during each hour of the 14-operating day period.[67] As will be discussed below in Section 4.5.3, this SIP revision is proposing to change this from the dual limit described above to a single 1069.1 lb/hr, 14-operating day average limit. A summary of the attainment modeling demonstration supporting the emissions limit will be discussed in Chapter 5, with the full documentation in Appendix C.

ADEQ Response: ADEQ agrees with these comments and has made the appropriate changes.

Comment 5: On page 71, in section 4.5.3.7 Compliance/Implementation Schedule, ASARCO believes that ADEQ has inadvertently maintained earlier language. ASARCO believes that the following language more accurately sets forth the implementation schedule:

The compliance/limitation schedule is defined in Appendix A. The operational controls and limitations in Condition II of the permit revision shall be implemented upon smelter restart or the time specified in Condition II, whichever is later.71 The requirements of Condition II are federally enforceable upon restart. The SO2 limitations in Condition Ill (Sulfur Dioxide Emissions Limitations) of the proposed permit revision shall become effective 60 days after the Hayden smelter achieves maximum production after restart or 180 days after restart, whichever occurs first, ~~or upon the Administrator's action approving Condition Ill as part of the state implementation plan for sulfur dioxide control, whichever occurs last~~. The requirements of Condition Ill are state enforceable only until the effective date of the EPA Administrator's action approving them as part of the SIP revision for sulfur dioxide control.

ADEQ Response: ADEQ agrees with these comments and has made the appropriate changes.

Comment 6: On page 73, top, ASARCO believes a bit more detail about the proposed compliance demonstration would assist EPA review. ASARCO proposes adding the following:

Requirements for the compliance demonstration are contained in the proposed permit revision.[75] This provides two compliance demonstrations, with the first being for main stack compliance.[76] The second, is the fugitive limit compliance demonstration.[77] Compliance with the main stack limit will be demonstrated by summing the emissions from each of the emission points CEMS, including the acid plant tail gas (flash furnace and converter blowing emissions), vent gas baghouse (flash furnace fugitives plus matte tapping and slag skimming emissions), secondary hood baghouse (converter secondary emissions, uptake improvement project and fuming ladle control emissions), converter tertiary hoods (converter tertiary emissions), anode furnace baghouse and anode secondary hood baghouse and calculating a new 14-operating day average each operating day to compare to the 1069.1 lb/hr 14-operating day main stack limit. For the fugitive sources, compliance would be demonstrated by comparing the hourly emissions from each area (flash furnace, converter aisle, and anode aisle) gathered by the roofline monitoring system to their respective limit.

ADEQ Response: ADEQ agrees with these comments and has made the appropriate changes.

Comment 7: On page 75, section 5 Attainment Demonstration and Reasonable Further Progress, ASARCO believes that in the second paragraph ADEQ meant to state that "ADEQ appointed ASARCO's modeling consultant, Blue Sky Modeling, to perform the attainment demonstration for the Hayden SO2 nonattainment area SIP, while ADEQ used its expertise in an oversight and review capacity." The current reference is to FMMI and AMEC.

ADEQ Response: ADEQ agrees that the reference to FMMI and AMEC was inadvertent. ADEQ agrees with the comment and has made the appropriate changes.

Comment 8: On page 77, section 5.1.2, ASARCO relies on security patrolling and cameras in addition to fencing and steep/rough terrain. Fencing is in place in all areas where the smelter abuts the Town of Hayden.

ADEQ Response: ADEQ agrees with the comment and has made the appropriate changes.

Comment 9: On page 98, section 9.9 Air Toxics, ADEQ states that "the Hayden smelter has the potential to emit more than 25 tons of hazardous air pollutants (HAP) and is a major source of HAPs emissions, and is therefore subject to National Emissions Standards for Hazardous Air Pollutants (NESHAP) for Primary Copper Smelting Major Sources, 40 CFR 63, Subpart QQQ." This statement is erroneous, lacks any foundation in the record of this SIP proceeding, and contradicts ADEQ's own air permit issued to the Hayden smelter, which establishes effective limits that preclude the Hayden smelter from being an area source if its potential to emit were to exceed 10 tons/year of any HAP or 25 tons/year of any combination of HAPs, which ASARCO denies has been the case. *See* Air Quality Permit No. 39948, Attachment "B", Condition II.A. (limiting total

HAP to less than 10 tons of any single HAP on a rolling 12-month basis and 25 tons of all HAPs on a rolling 12-month basis). These conditions are made enforceable by a comprehensive monitoring, testing, recordkeeping and compliance tracking program set forth in Conditions II.C through D. The Hayden smelter has not exceeded those limits. The SIP discussion is in error and must be corrected.

ADEQ Response: ADEQ agrees with these comments and has made the appropriate changes.

B. Questions

Below is a summary of verbal question ADEQ received during its August 14, 2023 public hearing and ADEQ's response

Question 1: One commenter asked if the improvements to the smelter from the 2017 SIP revision and permit revision had been completed.

ADEQ Response: As detailed in Section 5.5.1 of the SIP revision, Asarco's Converter Retrofit Project for the Hayden Smelter Operations was completed in 2018.

III. Revisions

Based on comments received by ADEQ, the Department has made the following revisions to the final version of ADEQ's *2023 Hayden Sulfur Dioxide Nonattainment Area for the 1971 and 2010 SO_2 NAAQS.*

1. On page 11, changed the "mine" to "smelter" in the second paragraph of Section 1.6.4. On page, changed 720,000 ton/year to 693,500 ton/year. On page 21, added Subpart EEEEEE to the list of NESHAPs in table 1-10.

2. On page 43, added the sentence "Secondary hood gases routed to the secondary hood baghouse are treated by high surface area lime injection for SO2 control" to Section 4.1.5. On page 44, amended the last sentence of 4.1.6 to read, "The baghouse initially exhausted through a dedicated stack, however the post-CRP configuration routes the exhaust to the 1,000-foot stack center"

3. On page 52, removed "anode furnace baghouse stack" from the first sentence of Section 4.4.1. On page 52, added a sentence to read, "Treated emissions from the acid plant are exhausted through the main stack center." Also, on page 52, ADEQ deleted the "(new)" before vent gas baghouse and changed "were vented to the annulus" to "are vented to the main stack annulus."

4. On page 59, made the changes recommended in Asarco's comment 4 to Section 4.5.2.4.7.

5. On page 64 removed the phrase "or upon the Administrator's action approving Condition III as part of the state implementation plan for sulfur dioxide control, whichever occurs last" from Section 4.5.3.7.

6. On page 66, added the following language to the Compliance Demonstration section of 4.5.3.9:

a. Compliance with the main stack limit will be demonstrated by summing the emissions from each of the emission points CEMS, including the acid plant tail gas (flash furnace and converter blowing emissions), vent gas baghouse (flash furnace fugitives plus matte tapping and slag skimming emissions), secondary hood baghouse (converter secondary emissions, uptake improvement project and fuming ladle control emissions), converter tertiary hoods (converter tertiary emissions), anode furnace baghouse and anode secondary hood baghouse and calculating a new 14-operating day average each operating day to compare to the 1069.1 lb/hr 14-operating day main stack limit. For the fugitive sources, compliance would be demonstrated by comparing the hourly emissions from each area (flash furnace, converter aisle, and anode aisle) gathered by the roofline monitoring system to their respective limit.

7. On page 68, corrected the second paragraph of Chapter 5 to read "ADEQ appointed Asarco's modeling consultant, Blue Sky Modeling,"

8. On page 70, in Section 5.1.2, added two sentences to read, "Asarco relies on security patrolling and cameras in addition to fencing and steep/rough terrain. Fencing is in place where the smelter abuts the Town of Hayden."

9. On Page 89, in Section 9.9, ADEQ amended the section to read:
Copper smelters are required to comply with the National Emission Standards to Hazardous Air Pollutants (NESHAP) for Primary Copper Smelting. The applicable NESHAPs for primary copper smelters are 40 CFR Part 63, Subpart QQQ (for major sources) and Subpart EEEEEE (for area sources). The Hayden smelter's permit establishes effective limits that precludes it from being an area source if its potential to emit 10 tons/year of any HAP or 25 tons/year of any combination of HAPs, which Asarco denies has been the case. *See* Air Quality Permit 39948, Attachment "B" Condition II.A (limiting total HAP to less than 10 tons of any single HAP on a rolling 12-month basis and 25 tons of all HAPs on a rolling 12-month basis). These conditions are made enforceable by a comprehensive monitoring, testing, recordkeeping and compliance tracking program set forth in Conditions II.C. through D. Asarco asserts that the Hayden smelter has not exceeded those limits. Therefore, ADEQ concludes that this SIP revision will not interfere with any applicable air toxics requirements of the CAA.

2 Compilation of Public Comments

ADEQ received the following public comments during its public comment period for the *2023 Hayden Sulfur Dioxide Nonattainment Area for the 1971 and 2010 SO_2 NAAQS* which ran from May 16, 2023 to June 15, 2023. As stated above, the only public comment ADEQ received was from Asarco, LLC dated June 15, 2023. A copy of this comment letter attached to this Appendix. The question received is transcribed in the August 14, 2023 hearing transcript contained in Appendix F.

The Arizona Revised Statutes have been updated to include the revised sections from the 55th Legislature, 2nd Regular Session. Please note that the next update of this compilation will not take place until after the conclusion of the 56th Legislature, 1st Regular Session, which convenes in January 2023.

DISCLAIMER

This online version of the Arizona Revised Statutes is primarily maintained for legislative drafting purposes and reflects the version of law that is effective on January 1st of the year following the most recent legislative session. The official version of the Arizona Revised Statutes is published by Thomson Reuters.

49-104. Powers and duties of the department and director

A. The department shall:

1. Formulate policies, plans and programs to implement this title to protect the environment.

2. Stimulate and encourage all local, state, regional and federal governmental agencies and all private persons and enterprises that have similar and related objectives and purposes, cooperate with those agencies, persons and enterprises and correlate department plans, programs and operations with those of the agencies, persons and enterprises.

3. Conduct research on its own initiative or at the request of the governor, the legislature or state or local agencies pertaining to any department objectives.

4. Provide information and advice on request of any local, state or federal agencies and private persons and business enterprises on matters within the scope of the department.

5. Consult with and make recommendations to the governor and the legislature on all matters concerning department objectives.

6. Promote and coordinate the management of air resources to ensure their protection, enhancement and balanced utilization consistent with the environmental policy of this state.

7. Promote and coordinate the protection and enhancement of the quality of water resources consistent with the environmental policy of this state.

8. Encourage industrial, commercial, residential and community development that maximizes environmental benefits and minimizes the effects of less desirable environmental conditions.

9. Ensure the preservation and enhancement of natural beauty and man-made scenic qualities

9. Ensure the preservation and enhancement of natural beauty and man-made scenic qualities.

10. Provide for the prevention and abatement of all water and air pollution including that related to particulates, gases, dust, vapors, noise, radiation, odor, nutrients and heated liquids in accordance with article 3 of this chapter and chapters 2 and 3 of this title.

11. Promote and recommend methods for the recovery, recycling and reuse or, if recycling is not possible, the disposal of solid wastes consistent with sound health, scenic and environmental quality policies. The department shall report annually on its revenues and expenditures relating to the solid and hazardous waste programs overseen or administered by the department.

12. Prevent pollution through the regulation of the storage, handling and transportation of solids, liquids and gases that may cause or contribute to pollution.

13. Promote the restoration and reclamation of degraded or despoiled areas and natural resources.

14. Participate in the state civil defense program and develop the necessary organization and facilities to meet wartime or other disasters.

15. Cooperate with the Arizona-Mexico commission in the governor's office and with researchers at universities in this state to collect data and conduct projects in the United States and Mexico on issues that are within the scope of the department's duties and that relate to quality of life, trade and economic development in this state in a manner that will help the Arizona-Mexico commission to assess and enhance the economic competitiveness of this state and of the Arizona-Mexico region.

16. Unless specifically authorized by the legislature, ensure that state laws, rules, standards, permits, variances and orders are adopted and construed to be consistent with and no more stringent than the corresponding federal law that addresses the same subject matter. This paragraph does not adversely affect standards adopted by an Indian tribe under federal law.

17. Provide administrative and staff support for the oil and gas conservation commission.

B. The department, through the director, shall:

1. Contract for the services of outside advisers, consultants and aides reasonably necessary or desirable to enable the department to adequately perform its duties.

2. Contract and incur obligations reasonably necessary or desirable within the general scope of department activities and operations to enable the department to adequately perform its duties.

3. Utilize any medium of communication, publication and exhibition when disseminating information, advertising and publicity in any field of its purposes, objectives or duties.

4. Adopt procedural rules that are necessary to implement the authority granted under this title, but that are not inconsistent

4. Adopt procedural rules that are necessary to implement the authority granted under this title, but that are not inconsistent with other provisions of this title.

5. Contract with other agencies, including laboratories, in furthering any department program.

6. Use monies, facilities or services to provide matching contributions under federal or other programs that further the objectives and programs of the department.

7. Accept gifts, grants, matching monies or direct payments from public or private agencies or private persons and enterprises for department services and publications and to conduct programs that are consistent with the general purposes and objectives of this chapter. Monies received pursuant to this paragraph shall be deposited in the department fund corresponding to the service, publication or program provided.

8. Provide for the examination of any premises if the director has reasonable cause to believe that a violation of any environmental law or rule exists or is being committed on the premises. The director shall give the owner or operator the opportunity for its representative to accompany the director on an examination of those premises. Within forty-five days after the date of the examination, the department shall provide to the owner or operator a copy of any report produced as a result of any examination of the premises.

9. Supervise sanitary engineering facilities and projects in this state, authority for which is vested in the department, and own or lease land on which sanitary engineering facilities are located, and operate the facilities, if the director determines that owning, leasing or operating is necessary for the public health, safety or welfare.

10. Adopt and enforce rules relating to approving design documents for constructing, improving and operating sanitary engineering and other facilities for disposing of solid, liquid or gaseous deleterious matter.

11. Define and prescribe reasonably necessary rules regarding the water supply, sewage disposal and garbage collection and disposal for subdivisions. The rules shall:

(a) Provide for minimum sanitary facilities to be installed in the subdivision and may require that water systems plan for future needs and be of adequate size and capacity to deliver specified minimum quantities of drinking water and to treat all sewage.

(b) Provide that the design documents showing or describing the water supply, sewage disposal and garbage collection facilities be submitted with a fee to the department for review and that no lots in any subdivision be offered for sale before compliance with the standards and rules has been demonstrated by approval of the design documents by the department.

12. Prescribe reasonably necessary measures to prevent pollution of water used in public or semipublic swimming pools and bathing places and to prevent deleterious conditions at those places. The rules shall prescribe minimum standards for the design of and for sanitary conditions at any public or semipublic swimming pool or bathing place and provide for abatement as public nuisances of premises and facilities that do not comply with the minimum standards. The rules shall be developed in cooperation

nuisances of premises and facilities that do not comply with the minimum standards. The rules shall be developed in cooperation with the director of the department of health services and shall be consistent with the rules adopted by the director of the department of health services pursuant to section 36-136, subsection I, paragraph 10.

13. Prescribe reasonable rules regarding sewage collection, treatment, disposal and reclamation systems to prevent the transmission of sewage borne or insect borne diseases. The rules shall:

(a) Prescribe minimum standards for the design of sewage collection systems and treatment, disposal and reclamation systems and for operating the systems.

(b) Provide for inspecting the premises, systems and installations and for abating as a public nuisance any collection system, process, treatment plant, disposal system or reclamation system that does not comply with the minimum standards.

(c) Require that design documents for all sewage collection systems, sewage collection system extensions, treatment plants, processes, devices, equipment, disposal systems, on-site wastewater treatment facilities and reclamation systems be submitted with a fee for review to the department and may require that the design documents anticipate and provide for future sewage treatment needs.

(d) Require that construction, reconstruction, installation or initiation of any sewage collection system, sewage collection system extension, treatment plant, process, device, equipment, disposal system, on-site wastewater treatment facility or reclamation system conform with applicable requirements.

14. Prescribe reasonably necessary rules regarding excreta storage, handling, treatment, transportation and disposal. The rules may:

(a) Prescribe minimum standards for human excreta storage, handling, treatment, transportation and disposal and shall provide for inspection of premises, processes and vehicles and for abating as public nuisances any premises, processes or vehicles that do not comply with the minimum standards.

(b) Provide that vehicles transporting human excreta from privies, septic tanks, cesspools and other treatment processes shall be licensed by the department subject to compliance with the rules. The department may require payment of a fee as a condition of licensure. The department may establish by rule a fee as a condition of licensure, including a maximum fee. As part of the rulemaking process, there must be public notice and comment and a review of the rule by the joint legislative budget committee. The department shall not increase that fee by rule without specific statutory authority for the increase. The fees shall be deposited, pursuant to sections 35-146 and 35-147, in the solid waste fee fund established by section 49-881.

15. Perform the responsibilities of implementing and maintaining a data automation management system to support the reporting requirements of title III of the superfund amendments and reauthorization act of 1986 (P.L. 99-499) and article 2 of this chapter.

16. Approve remediation levels pursuant to article 4 of this chapter.

17. Establish or revise fees by rule pursuant to the authority granted under title 44, chapter 9, article 8 and chapters 4 and 5 of this title for the department to adequately perform its duties. All fees shall be fairly assessed and impose the least burden and cost to the parties subject to the fees. In establishing or revising fees, the department shall base the fees on:

(a) The direct and indirect costs of the department's relevant duties, including employee salaries and benefits, professional and outside services, equipment, in-state travel and other necessary operational expenses directly related to issuing licenses as defined in title 41, chapter 6 and enforcing the requirements of the applicable regulatory program.

(b) The availability of other funds for the duties performed.

(c) The impact of the fees on the parties subject to the fees.

(d) The fees charged for similar duties performed by the department, other agencies and the private sector.

18. Appoint a person with a background in oil and gas conservation to act on behalf of the oil and gas conservation commission and administer and enforce the applicable provisions of title 27, chapter 4 relating to the oil and gas conservation commission.

C. The department may:

1. Charge fees to cover the costs of all permits and inspections it performs to ensure compliance with rules adopted under section 49-203, except that state agencies are exempt from paying those fees that are not associated with the dredge and fill permit program established pursuant to chapter 2, article 3.2 of this title. For services provided under the dredge and fill permit program, a state agency shall pay either:

(a) The fees established by the department under the dredge and fill permit program.

(b) The reasonable cost of services provided by the department pursuant to an interagency service agreement.

2. Monies collected pursuant to this subsection shall be deposited, pursuant to sections 35-146 and 35-147, in the water quality fee fund established by section 49-210.

3. Contract with private consultants for the purposes of assisting the department in reviewing applications for licenses, permits or other authorizations to determine whether an applicant meets the criteria for issuance of the license, permit or other authorization. If the department contracts with a consultant under this paragraph, an applicant may request that the department

expedite the application review by requesting that the department use the services of the consultant and by agreeing to pay the department the costs of the consultant's services. Notwithstanding any other law, monies paid by applicants for expedited reviews pursuant to this paragraph are appropriated to the department for use in paying consultants for services.

D. The director may:

1. If the director has reasonable cause to believe that a violation of any environmental law or rule exists or is being committed, inspect any person or property in transit through this state and any vehicle in which the person or property is being transported and detain or disinfect the person, property or vehicle as reasonably necessary to protect the environment if a violation exists.

2. Authorize in writing any qualified officer or employee in the department to perform any act that the director is authorized or required to do by law.

49-106. Statewide application of rules

The rules adopted by the department apply and shall be observed throughout this state, or as provided by their terms, and the appropriate local officer, council or board shall enforce them. This section does not limit the authority of local governing bodies to adopt ordinances and rules within their respective jurisdictions if those ordinances and rules do not conflict with state law and are equal to or more restrictive than the rules of the department, but this section does not grant local governing bodies any authority not otherwise provided by separate state law.

The official version of the Arizona Revised Statutes is published by Thomson Reuters.

49-402. State and county control

A. The department shall have original jurisdiction over such sources, permits and violations that pertain to:

1. Major sources in any county that has not received approval from the administrator for new source review under the clean air act and prevention of significant deterioration under the clean air act.

2. Smelting of metal ore.

3. Petroleum refineries.

4. Coal fired electrical generating stations.

5. Portland cement plants.

6. Air pollution by portable sources.

7. Air pollution by mobile sources for the purpose of regulating those sources as prescribed by article 5 of this chapter and consistent with the clean air act.

8. Sources that are subject to title V of the clean air act and that are located in a county for which the administrator has disapproved that county's title V permit program if the department has a title V program that has been approved by the administrator. On approval of that county's title V permit program by the administrator, the county shall resume jurisdiction over those sources.

B. Except as specified in subsection A of this section, the review, issuance, administration and enforcement of permits issued pursuant to this chapter shall be by the county or multi-county air quality control region pursuant to the provisions of article 3 of this chapter. After the director has provided prior written notice to the control officer describing the reason for asserting jurisdiction and has provided an opportunity to confer, the county or multi-county air quality control region shall relinquish

jurisdiction and has provided an opportunity to confer, the county or multi-county air quality control region shall relinquish jurisdiction, control and enforcement over such permits as the director designates and at such times as the director asserts jurisdiction at the state level. The order of the director which asserts state jurisdiction shall specify the matters, geographical area, or sources over which the department shall exercise jurisdiction and control. Such state authority shall then be the sole and exclusive jurisdiction and control to the extent asserted, and the provisions of this chapter shall govern, except as provided in this chapter, until jurisdiction is surrendered by the department to such county or region.

C. Portable sources under jurisdiction of the department under subsection A, paragraph 6 of this section may be required to file notice with the director and the control officer who has jurisdiction over the geographic area that includes the new location before beginning operations at that new location.

D. Notwithstanding any other law, a permit issued to a state regulated source shall include the emission standard or standard of performance adopted pursuant to section 49-479, if such standards are more stringent than those adopted by the director and if such standards are specifically identified as applicable to the permitted source or a component of the permitted source. Such standards shall be applied to sources identified in subsection A, paragraph 2, 3, 4 or 5 of this section only if the standard is formally proposed for adoption as part of the state implementation plan.

E. The regional planning agency for each county which contains a vehicle emissions control area shall develop plan revisions containing transportation related air quality control measures designed to attain and maintain primary and secondary ambient air quality standards as prescribed by and within the time frames specified in the clean air act. In developing the plan revisions, the regional planning agency shall consider all of the following:

1. Mandatory employee parking fees.

2. Park and ride programs.

3. Removal of on-street parking.

4. Ride share programs.

5. Mass transit alternatives.

6. Expansion of public transportation systems.

7. Optimizing freeway ramp metering.

8. Coordinating traffic signal systems.

9. Reduction of traffic congestion at major intersections.

10. Site specific transportation control measures.

11. Reversible lanes.

12. Fixed lanes for buses and carpools.

13. Encouragement of pedestrian travel.

14. Encouragement of bicycle travel.

15. Development of bicycle travel facilities.

16. Employer incentives regarding ride share programs.

17. Modification of work schedules.

18. Strategies for controlling the generation of air pollution by nonresidents of nonattainment or maintenance areas.

19. Use of alternative fuels.

20. Use of emission control devices on public diesel powered vehicles.

21. Paving of roads.

22. Restricting off-road vehicle travel.

23. Construction site air pollution control.

24. Other air quality control measures.

F. Each regional planning agency shall consult with the department of transportation to coordinate the plans developed pursuant to subsection E of this section with transportation plans developed by the department of transportation pursuant to any other law.

49-404. State implementation plan

A. The director shall maintain a state implementation plan that provides for implementation, maintenance and enforcement of national ambient air quality standards and protection of visibility as required by the clean air act.

B. The director may adopt rules that describe procedures for adoption of revisions to the state implementation plan.

C. The state implementation plan and all revisions adopted before September 30, 1992 remain in effect according to their terms, except to the extent otherwise provided by the clean air act, inconsistent with any provision of the clean air act, or revised by the administrator. No control requirement in effect, or required to be adopted by an order, settlement agreement or plan in effect, before the enactment of the clean air act in any area which is a nonattainment or maintenance area for any air pollutant may be modified after enactment in any manner unless the modification insures equivalent or greater emission reductions of the air pollutant. The director shall evaluate and adopt revisions to the plan in conformity with federal regulations and guidelines promulgated by the administrator for those purposes until the rules required by subsection B are effective.

49-406. Nonattainment area plan

A. For any ozone, carbon monoxide or particulate nonattainment or maintenance area the governor shall certify the metropolitan planning organization designated to conduct the continuing, cooperative and comprehensive transportation planning process for that area under 23 United States Code section 134 as the agency responsible for the development of a nonattainment or maintenance area plan for that area.

B. For any ozone, carbon monoxide or particulate nonattainment or maintenance area for which no metropolitan planning organization exists, the department shall be certified as the agency responsible for development of a nonattainment or maintenance area plan for that area.

C. For any ozone, carbon monoxide or particulate nonattainment or maintenance area, the department, the planning agency certified pursuant to subsection A of this section on behalf of elected officials of affected local government, the county air pollution control department or district, and the department of transportation shall, by November 15, 1992, and from time to time as necessary, jointly review and update planning procedures or develop new procedures.

D. In preparing the procedures described in subsection C of this section, the department, the planning agency certified pursuant to subsection A of this section on behalf of elected officials of affected local government, the county air pollution control department or district, and the department of transportation shall determine which elements of each revised implementation plan will be developed, adopted, and implemented, through means including enforcement, by the state and which by local governments or regional agencies, or any combination of local governments, regional agencies or the state.

E. The department, the planning agency certified pursuant to subsection A of this section on behalf of elected officials of affected local government, the county air pollution control department or district, and the department of transportation shall enter into a memorandum of agreement for the purpose of coordinating the implementation of the procedures described in subsection C and D of this section

D of this section.

F. At a minimum, the memorandum of agreement shall contain:

1. The relevant responsibilities and authorities of each of the coordinating agencies.

2. As appropriate, procedures, schedules and responsibilities for development of nonattainment or maintenance area plans or plan revisions and for determining reasonable further progress.

3. Assurances for adequate plan implementation.

4. Procedures and responsibilities for tracking plan implementation.

5. Responsibilities for preparing demographic projections including land use, housing, and employment.

6. Coordination with transportation programs.

7. Procedures and responsibilities for adoption of control measures and emissions limitations.

8. Responsibilities for collecting air quality, transportation and emissions data.

9. Responsibility for conducting air quality modeling.

10. Responsibility for administering and enforcing stationary source controls.

11. Provisions for the timely and periodic sharing of all data and information among the signatories relating to:

(a) Demographics.

(b) Transportation.

(c) Emissions inventories.

(d) Assumptions used in developing the model.

(e) Results of modeling done in support of the plan.

(f) Monitoring data.

G. Each agency that commits to implement any emission limitation or other control measure, means or technique contained in the implementation plan shall describe that commitment in a resolution adopted by the appropriate governing body of the agency. The resolution shall specify the following:

1. Its authority for implementing the limitation or measure as provided in statute, ordinance or rule.

2. A program for the enforcement of the limitation or measure.

3. The level of personnel and funding allocated to the implementation of the measure.

H. The state, in accordance with the rules adopted pursuant to section 49-404, and the governing body of the metropolitan planning organization shall adopt each nonattainment or maintenance area plan developed by a certified metropolitan planning organization. The adopted nonattainment or maintenance area plan shall be transmitted to the department for inclusion in the state implementation plan provided for under section 49-404.

I. After adoption of a nonattainment or maintenance area plan, if on the basis of the reasonable further progress determination described in subsection F of this section or other information, the control officer determines that any person has failed to implement an emission limitation or other control measure, means or technique as described in the resolution adopted pursuant to subsection G of this section, the control officer shall issue a written finding to the person, and shall provide an opportunity to confer. If the control officer subsequently determines that the failure has not been corrected, the county attorney, at the request of the control officer, shall file an action in superior court for a preliminary injunction, a permanent injunction, or any other relief provided by law.

J. After adoption of a nonattainment or maintenance area plan, if, on the basis of the reasonable further progress determination described in subsection F of this section or other information, the director determines that any person has failed to implement an emission limitation or other control measure, means or technique as described in the resolution adopted pursuant to subsection G of this section, and that the control officer has failed to act pursuant to subsection I of this section, the director shall issue a written finding to the person and shall provide an opportunity to confer. If the director subsequently determines that the failure has not been corrected, the attorney general, at the request of the director, shall file an action in superior court for a preliminary injunction, a permanent injunction, or any other relief provided by law.

K. Notwithstanding subsections A and B of this section, in any metropolitan area with a metropolitan statistical area population of less than two hundred fifty thousand persons, the governor shall designate an agency that meets the criteria of section 174 of the clean air act and that is recommended by the city that causes the metropolitan area to exist and the affected county. That agency shall prepare and adopt the nonattainment or maintenance area plan. If the governor does not designate an agency, the department shall be certified as the agency responsible for the development of a nonattainment or maintenance area plan for that area.

49-425. Rules; hearing

A. The director shall adopt such rules as the director determines are necessary and feasible to reduce the release into the atmosphere of air contaminants originating within the territorial limits of the state or any portion thereof and shall adopt, modify and amend reasonable standards for the quality of and emissions into the ambient air of the state for the prevention, control and abatement of air pollution. Additional standards shall be established for particulate matter emissions, sulfur dioxide emissions and other air contaminant emissions determined to be necessary and feasible for the prevention, control and abatement of air pollution. In fixing such ambient air quality standards, emission standards or standards of performance, the director shall give consideration but shall not be limited to the relevant factors prescribed by the clean air act.

B. No rule may be enacted or amended except after the director first holds a public hearing after thirty days' notice of such hearing. The proposed rule, or any proposed amendment of a rule, shall be made available to the public at the time of notice of such hearing.

C. The department shall enforce the rules adopted by the director.

D. All rules enacted pursuant to this section shall be made available to the public at a reasonable charge on request.

49-426. Permits; duties of director; exceptions; applications; objections; fees

A. A permit shall:

1. Be issued by the director in compliance with the terms of this section.

2. Be required for any person seeking a compliance extension pursuant to section 49-426.03, subsection B, paragraph 3 and section 112(a)(5) of the clean air act and for any person beginning actual construction of or operating any source, except as prescribed in subsection B of this section or section 49-426.01.

B. The provisions of this section shall not apply to motor vehicles, to agricultural vehicles or agricultural equipment used in normal farm operations, or to fuel burning equipment which, at a location or property other than a one or two family residence, is rated at less than one million British thermal units per hour. The director may establish by rule additional sources or classifications of sources for which a permit is not required and pollutant-emitting activities and emissions units at permitted sources that are not required to be included in the permit. The director shall not adopt such rules unless the director makes a written finding with supporting facts that the exempted source, class of sources, pollutant-emitting activities or emissions units will have an insignificant adverse impact on air quality. In adopting these rules, the director may consider any rule that is adopted by the administrator pursuant to section 502 of the clean air act and that exempts one or more source categories from the requirement to obtain a permit under title V of the clean air act.

C. Every application for a permit shall be filed in the manner and form prescribed by the director, and shall contain all the information necessary to enable the director to make the determination to grant or deny such application. The director shall establish by rule requirements for permit applications, including the standard application form for title V sources. The director shall establish by rule requirements for applications for general permits. An application for a permit issued pursuant to title V of

the clean air act shall include a compliance plan that describes how the applicant will comply with all of the applicable requirements of this chapter and the clean air act, including a schedule of compliance and a schedule under which progress reports will be submitted to the director at least every six months. The director may require that such application include all sources that are used or to be used by the applicant in a certain process or a single facility or location. Before acting on an

sources that are used or to be used by the applicant in a certain process or a single facility or location. Before acting on an application for a permit, the director may require the applicant to furnish further information or further plans or specifications. The director shall act, within a reasonable time, on such application and shall notify the applicant in writing of the proposed approval or denial of such application, except that the director may have a reasonable period of time in which to gather information, inspect premises, and issue such permits. The director shall adopt rules that establish procedures for determining when applications are complete, for processing applications and for reviewing permit actions. The director shall also establish by rule criteria for determining reasonable times for processing permit applications. Rules adopted pursuant to this subsection for permits issued pursuant to title V of the clean air act shall conform to the requirements of section 505(a) of the clean air act.

D. The director shall give notice of a proposed permit for a source required to obtain a permit pursuant to title V of the clean air act once each week for two consecutive weeks in two newspapers of general circulation in the county in which the source is or will be located. The notice shall describe the proposed permit and air contaminants to be emitted and shall state that any person may submit comments on the proposed permit and may request a public hearing. The director shall require the applicant at the time of the first notice to post the site where the source is or may be located. If permitted by federal, state and local law, the posting shall be prominently placed at a site that is under the applicant's legal control and that is adjacent to the nearest public roadway. The posting shall be visible to the public using the public roadway and shall contain the information in the notice that is published by the director. If a public hearing is requested, the director shall require the applicant to place an additional posting that provides notice of the public hearing. A posting shall be maintained until the public comment period on the proposed permit is closed. The director shall make available to the public notices of proposed permits. Each public notice that is issued under this chapter shall be mailed to the permit applicant, to the affected federal, state and local agencies and to those persons who have requested in writing copies of proposed permit action notices. During the public comment period, any person may submit a request to the department to conduct a public hearing for the purpose of receiving oral or written comments on the proposed permit. A written comment shall state the name and mailing address of the person, shall be signed by the person, his agent or his attorney and shall clearly set forth reasons why the permit should or should not be issued. Grounds for comment are limited to whether the proposed permit meets the criteria for issuance prescribed in this section or in section 49-427. The department shall consider and prepare written responses to all comments received during the public comment period including comments made at a public hearing conducted by the department. At the time a final permit decision is made, copies of the department's responses shall be made available to the applicant and any person who commented on the proposed permit.

E. Permits or revisions issued pursuant to this section or section 49-426.01 may be issued subject to such terms and conditions as are consistent with the requirements of this article, article 1 of this chapter and the clean air act and are found by the director to be necessary, following public notice and an opportunity for a public hearing as provided in subsection D or H of this section or in section 49-426.01, and subject to payment of a reasonable fee to be determined as follows:

1. For a source that is required to obtain a permit pursuant to title V of the clean air act, the director shall establish by rule a system of fees that is consistent with and equivalent to that prescribed by section 502 of the clean air act. These rules shall prescribe procedures for increasing the fee each year by the percentage if any by which the consumer price index for the immediately preceding calendar year exceeds the consumer price index for calendar year 1989.

2. For a facility that is required to obtain a permit pursuant to this chapter but that is not required to obtain a permit pursuant to title V of the clean air act, the director shall determine a fee based on the total actual cost of processing the permit application

title V of the clean air act, the director shall determine a fee based on the total actual cost of processing the permit application, but not exceeding twenty-five thousand dollars.

The director shall establish an annual inspection fee, not to exceed the average cost of inspection. The director shall adopt, by rule, criteria for determining fees and for public hearings.

F. Permits issued pursuant to this section shall be issued for a period of five years.

G. Except as provided in subsection H of this section, any person burning used oil, used oil fuel, hazardous waste or hazardous waste fuel in any machine, incinerator or device shall first obtain a permit from the director. Any permit issued by the director under this subsection shall contain, at a minimum, conditions governing:

1. Limitations on the types, amounts and feed rates of used oil, used oil fuel, hazardous waste or hazardous waste fuel which may be burned.

2. The frequency and types of fuel testing to be conducted by the person.

3. The frequency and type of emissions testing or monitoring to be conducted by the person.

4. Requirements for record keeping and reporting.

5. Numeric emission limitations expressed in pounds per hour and tons per year for air contaminants to be emitted from the facility burning off-specification used oil fuel, hazardous waste or hazardous waste fuel.

H. The director may issue a general permit for a defined class of facilities if the class contains a large number of facilities that are substantially similar in nature and that have substantially similar emissions and if the following conditions are met:

1. A general permit shall comply with all of the requirements for permits prescribed by this section except for the requirements of subsection D of this section and shall be consistent with the clean air act.

2. The director shall give notice of the proposed general permit once each week for two consecutive weeks in a newspaper of general circulation in each county. The notice shall describe the proposed general permit, the general class of sources that would be subject to the proposed permit and the air contaminants to be emitted. The notice shall also state that any person may submit comments on the proposed general permit and may request a public hearing. A written comment shall state the name of the person and the person's agent or attorney and shall clearly set forth reasons why the general permit should or should not be issued. Grounds for comment are limited to whether the proposed general permit meets the criteria for issuance prescribed in this section or section 49-427.

3. On issuance of a general permit any person seeking to permit a source under this subsection shall submit an application pursuant to subsection C of this section.

4. If the director approves an application to be permitted under a general permit, the director shall provide notice of the approval

4. If the director approves an application to be permitted under a general permit, the director shall provide notice of the approval in a newspaper of general circulation in the county in which the source is or will be located.

5. If a person violates a general permit, the director may require the source to obtain a permit pursuant to subsection A of this section.

6. A general permit may be revoked or revised at any time by the director if necessary to comply with this chapter. If the director revokes or revises a general permit, the director shall notify all persons whose sources are affected by the revocation or revision and shall include notice of procedures to obtain a permit pursuant to subsection A of this section or notice of procedures for compliance with the revisions.

7. The director by rule shall adopt procedures for the issuance of general permits.

8. The director may adopt conditions in a general permit applicable to sources located in a specified geographic area either independently of or upon petition by a county air pollution control officer.

I. Permits issued pursuant to this section for a source required to obtain a permit under title V of the clean air act shall contain all of the following:

1. Conditions reflecting all applicable requirements of this article and rules adopted pursuant to this article.

2. Enforceable emission limitations and standards.

3. A schedule for compliance, if applicable.

4. The requirement to submit at least every six months the results of any required monitoring.

5. Any other conditions that are necessary to assure compliance with this article and the clean air act, including the applicable implementation plan.

J. The director may refuse to issue any permit to any source subject to the requirements of title V of the clean air act if the administrator objects to its issuance in a timely manner as prescribed under title V of the act.

K. If an applicant has submitted a timely and complete application for a permit required under this section, but final action has not been taken on that application, failure to obtain a permit shall not be a violation of this chapter unless the delay in final action is due to the failure of the applicant to submit information required or requested to process the application. This subsection does not apply to any person required to obtain a permit before commencing construction of a source as required under this section or any person seeking a permit revision as provided under section 49-426.01.

L. The director may issue a single permit authorizing emissions from similar operations at multiple temporary locations, if the permit includes conditions that will assure compliance with all applicable requirements of this chapter and the clean air act at all locations. Any permit issued pursuant to this subsection shall require the applicant to notify the director in advance of each change in location. In issuing a single permit, the director may require a separate permit fee for operations at each location.

change in location. In issuing a single permit, the director may require a separate permit fee for operations at each location.

M. In the case of a permit with a term of three or more years issued pursuant to the requirements of title V of the clean air act to a major source, the director shall require revisions to the permit to incorporate applicable standards and regulations adopted by the administrator pursuant to the clean air act after the issuance of the permit. The director shall require any revisions as expeditiously as practicable, but not later than eighteen months after the promulgation of such standards and regulations. No permit revision shall be required if the effective date of standards and regulations is after the expiration of the permit. Any permit revision required pursuant to this subsection shall be treated as a permit renewal.

N. Any permit issued pursuant to the requirements of this article and title V of the clean air act to a unit subject to the provisions of title IV of the clean air act shall include conditions prohibiting all of the following:

1. Annual emissions of sulfur dioxide in excess of the number of allowances to emit sulfur dioxide held by the owners or operators of the unit or by the designated representative of the owners or operators.

2. Amounts in excess of applicable emission rates.

3. The use of any allowance prior to the year for which it was allocated.

4. Contravention of any other provision of the permit.

O. The director shall adopt a rule specifying the notice, public participation requirements and other permit issuance procedures for permits that are not issued pursuant to title V of the clean air act.

P. In determining whether a permitting threshold established pursuant to this section applies to an existing source, the director shall exclude particulate matter that is not subject to a national ambient air quality standard under the clean air act.

ADEQ Arizona Department of Environmental Quality

Memorandum

Date: February 28, 2023
To: Daniel Czecholinski, Air Quality Division Director
From: Karen Peters, Director
Subject: Air Quality Division Delegation of Authority

Under A.R.S. §49-104 (D) (2), I authorize you, Daniel Czecholinski, Division Director, Air Quality Division, Arizona Department of Environmental Quality, to perform any act, including execution of any pertinent documents, which I, as Director of the Arizona Department of Environmental Quality, am authorized or required to do by law with Respect to A.R.S Title 49, Chapters 1 and 3 and any other acts related to air quality including personnel actions.

This authority shall remain in effect until it is revoked or upon your separation from the Arizona Department of Environmental Quality. You may further delegate this authority in the best interest of the agency, however, those delegations must be in writing and you must forward a copy of any further delegations to me.

This delegation is effective as of February 28, 2023, and revokes all earlier delegations. I ratify all acts performed by you as Air Quality Division Director concerning the duties and functions in this delegation memorandum.
