

From Source to Tap:

The Journey of Water

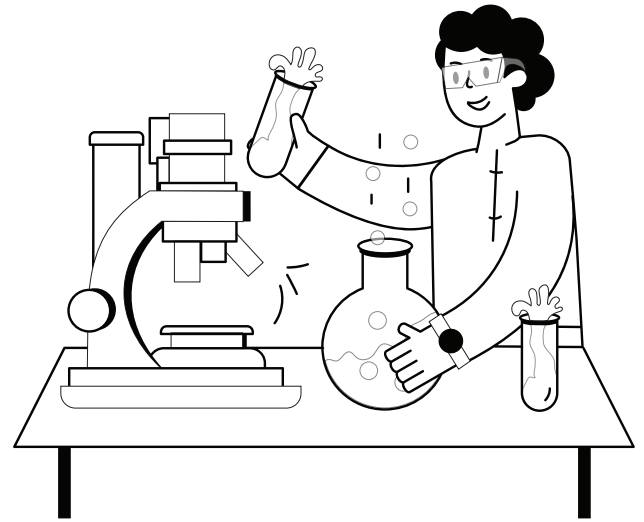

In Arizona, water starts its journey from a river, lake, reservoir or deep beneath the ground in an aquifer.

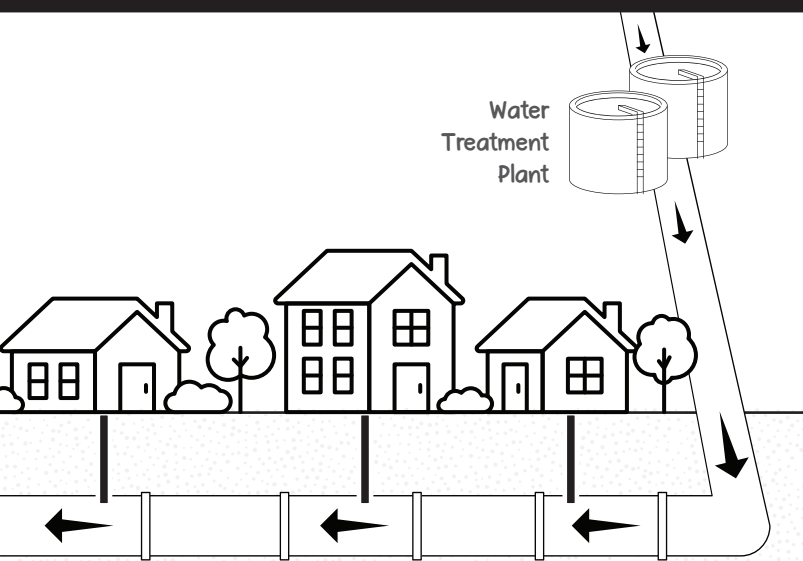

1

Lake/river water is pumped to a water treatment plant, and is ready for testing after treatment. Groundwater may also go to a treatment plant or directly into the water distribution (piping) system.

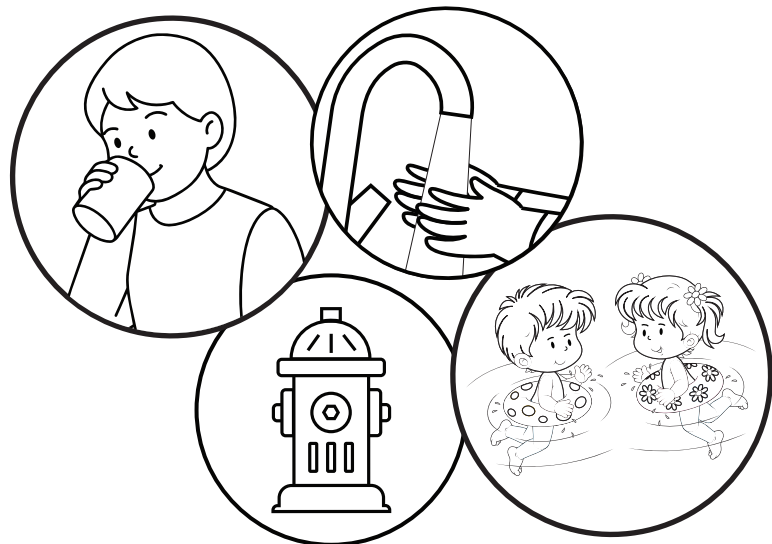

2

Before water can go to your home, it is tested at a certified laboratory for things like bacteria, nitrate, metals and other things that can be harmful.

3

Water travels through underground pipes to homes, work and schools.

4

Then, when you want, just turn on the faucet and it's ready for us to use!
