1 SECURITY

A chain link fence with three strands of barbed wire surrounds the facility with the main gate located on Storey Road. The main gate is controlled by restricted electronic key access and can be opened/closed from controls inside the office. A gate for railcar ingress/egress located at the northeast corner of the property is kept locked at all times with a padlock. If the railcar gate is unlocked, Heritage personnel will be present in the vicinity at all times. There is a pedestrian ingress/egress gate located at the southeast corner of the property. It is always kept locked. Keys for the locks are maintained by key employees, and spare keys are stored in the office. An additional access gate on Storey Road, which is normally locked, can be accessed by the City of Coolidge Fire Department. This gate is locked with keys maintained by Heritage employees and the Coolidge Fire Department.

The typical operating hours of the facility are 6:00 A.M. to 5:00 P.M., seven days per week. In the event of an evacuation, facility personnel control access to the facility (see Evacuation Plan in Section 7 of the Contingency Plan).

An automatic gate at the main entrance on Storey Road controls entrance to the facility. Access to the office building is permitted by the front door, into a reception area. Visitors must sign in the logbook and wait for authorized personnel in the reception area. Any on-site visitors are accompanied at all times by Heritage employees. Visitors are required to sign out upon leaving the facility. Contractors must follow Heritage's written program titled "Contractors Safety Guide." Signs are posted at the main entrance, the northeast entrance, and other approachable sides of the facility fence. The signs read "Danger - Unauthorized Personnel Keep Out." The signs are legible from a distance of at least 25 feet. The legend is printed in English and Spanish at the Coolidge facility.

In addition to the security requirements required by 40 CFR Part 264.14(b)(2)(i) and (ii), Heritage provides additional security measures that consist of surveillance cameras that record images at strategic locations within active areas of the facility and other electronic security measures. Additional information concerning the security devices at the facility is provided in Appendix D-B. In lieu of security cameras or similar devices, Heritage may provide 24-hour onsite security personnel.

[2] See Table D-A in Appendix D-A for additional details.

The schedule of inspections and the Inspection Reports are maintained by the Environmental Compliance Manager. Specific items that will be inspected are detailed in Appendix D-A. An example Inspection Findings Form that can be used to document inspection dates, corrective actions, and completion dates is also provided in Appendix D-A. Corrective action that is needed, as noted at any inspection, must be initiated within 24 hours and completed as early as possible.

3 EQUIPMENT REQUIREMENTS

3.1 Communication Equipment

Internal communications and alarm systems used to provide immediate emergency instruction to the facility are discussed in the Evacuation Plan located in Section 7 of the Contingency Plan. Telephones capable of making external calls are located in the office, the laboratory building, and the maintenance building. Emergency telephone numbers are outlined in Section 8 of the Contingency Plan. Employees are equipped with two-way radios or have access to air horns to alert key personnel of an emergency.

3.2 Emergency Equipment

An emergency equipment list is located in Appendix G-D of the Contingency Plan.

3.3 Aisle Space Requirements

The facility maintains sufficient aisle space, a minimum of two feet, to allow the unobstructed movement of personnel, fire protection equipment, or spill control equipment to any area of facility in the event of an emergency. For containers that are stored on containment pallets in adjacent rows, the distance between the containers is at least two feet.

3.4 Sprinkler Suppression System

The Central Container Storage Area and the 800 Container Storage Area are equipped with an automatic fire suppression system that is water-AR-AFFF foam based. The system was designed in accordance with NFPA 30 incorporated into the 2003 International Fire Code which was the standard adopted by the Arizona State Fire Marshal at the time of installation. The fire suppression system installed in the Central Storage Area and the 800 Area Container Storage are suitable for storage of hazardous materials including flammable liquids. In addition to the sprinkler system, the Central Storage Area and the 800 Container Storage Area are equipped with a beam smoke detection system and photoionization smoke detection system as a means to detect fire/smoke in advance of sprinkler system activation and provide early warning to emergency responders. Appendix D-C provides drawings of the fire suppression and alarm system.

There are also several water outlets within the facility that may be utilized in an emergency. There are eight water storage tanks at the facility that are filled by groundwater from an on-site water production well that is designed to pump ground water in excess of 600 gallons per minute. The tanks are equipped with low-level alarms. Heritage controls water rights for the aquifer beneath the facility, and water usage is well below the volume of water rights. In addition to the sprinkler suppression system, the Heritage facility is protected by conventional ABC fire extinguishers. There are also 55-gallon containers of AFFF fire suppression foam available for response to a fire. Heritage personnel have been trained in fire response by the local fire department.

3.4.1 Fire Protection Measures

Heritage maintains the following measures for fire protection:

1. Heritage has a fire suppression system serving the Central Container Storage Area and the 800 Area Container Storage Area at the facility. This system is maintained in operational status.
2. Heritage has an existing system of water storage tanks at the facility that are filled by a groundwater production well. The current volume of water in storage exceeds 126,900 gallons. The pumps and water tank systems are maintained in operational status. The water well is designed to pump ground water at a rate in excess of 600 gallons per minute to replenish water storage tanks in the event of an emergency.
3. Heritage maintains its water rights, sufficient to provide adequate volume of water to the water storage tank system. Heritage has not sold or traded any of its water rights for the facility.
4. The Heritage facility is also served by the City of Coolidge Fire Department. The City of Coolidge has informed Heritage of additional equipment purchases that enable even more sophisticated response to emergencies at the Heritage facility. The advanced equipment ordered by the City of Coolidge reduced the quantity of water necessary for fire-fighting, in comparison to existing equipment and technology.
5. The City of Coolidge has in place a written Mutual Aid Agreement with the following municipal fire departments within Pinal County:
    - Casa Grande Fire Department
    - Eloy Fire Department
    - Maricopa Fire Department
    - Arizona City Fire District
    - Avra Valley Fire District
    - Florence Fire Department
    - Golder Ranch Fire District
    - Kearny Fire Department
    - Stanfield Fire Department
    - Regional Fire & Rescue Department
    - Gila River Indian Community Fire Department
6. Heritage has four 55-gallon canisters of AFFF fire suppression foam in inventory. The canisters are stored outside the southwest corner of the Central Container Storage Area. As part of the Agreement with the City of Coolidge, the Coolidge Fire Department owns and will provide the foam eductors necessary for application of the AFFF foam on-site at Heritage, should it be required in an emergency.
7. In addition to hand-held A/B/C fire extinguishers, Heritage has two 125-pound fire extinguishers rated B/C for flammable liquid and electrical fires (both located at the Central Container Storage Area) and two Class D fire extinguishers (one located in the Lab Depack Area and one located in Area 800 by the north door).

8. Heritage employees have been trained in the use of Fire Extinguishers.
9. Heritage employees have been trained in the Contingency Plan and Procedures to Prevent Hazards documents established for emergencies at the facility.
10. Heritage has established "No Smoking" areas and appropriate signage. Heritage also has a "Safe Work Permit" program that would prevent performance of any "hot work," such as welding in the areas where hazardous wastes are stored, without the proper precautions (e.g., relocation of combustible materials).

4 PREVENTIVE PROCEDURES, STRUCTURES, AND EQUIPMENT

4.1 Unloading and Consolidation Operations

Unloading procedures for containerized wastes are discussed in the Container Storage and Consolidation Plan (Section D). Container loading and unloading is conducted with specialized equipment designed to move containers in accordance with written Standard Operating Procedures (SOPs). Consolidation operations, including solids (filter cake) blending, is conducted with specialized equipment in accordance with written SOPs. Consolidation equipment, including housekeeping tools, is tested and maintained and inspected prior to use.

The following SOP's related to bulking, blending, and consolidation will be maintained at the facility:

- F006 Blending and Consolidation
- Organic Waste Consolidation
- Bulking for Shipment Offsite

4.2 Run-on / Run-off

All hazardous waste activities are conducted indoors, under roof with curbing, or in otherwise contained areas. The facility has the following controls to prevent run-on/runoff of storm water.

General Facility Controls: The facility has a soil berm constructed on the north, east and west side of the perimeter fence with the exception of areas where access is required (e.g., the rail spur). These berms mitigate potential run-on and run-off from the facility. Based on visual observation, drainage conveyances are constructed along the railroad and along East Storey Road to prevent run-on to the facility from potential offsite sources.

Central Storage Area – The Central Storage Area is constructed of poured concrete walls up to approximately 4 feet above the surrounding grade. Above the concrete wall, the Central Storage Area is a metal-sided building with a roof to prevent precipitation from entering the Central Storage Area. These structures serve to mitigate any potential run-on into the unit and prevent precipitation from accumulating. Although located in an indoor structure under roof, the sloped floors coupled with blind sumps of the Central Storage Area would serve to prevent run-off from the unit.

Roll Off Container Storage Area – The Roll-Off Container Storage Area is a contained area that consists of block walls on the east and north sides of the unit that are approximately

eight feet in height. On the south side of the unit, a six-inch concrete curb is present at the Roll-Off Container Storage Area. On the west side of the unit, a 3-inch curb is present at the Roll-Off Container Storage Area. The structures are constructed in a manner that they are sufficiently above the surrounding grade to prevent run-on/run off at the unit. Additional detail concerning the construction of the curbs is provided in Section D of the permit application.

Dock and Van Container Storage Area (DVSA) – The DVSA secondary containment volume is sufficient to contain precipitation from a 25-year/24-hour storm event including any run-on into the unit which was based on land surveying conducted to determine the drainage area in the vicinity of the DVSA. Section D of the permit application provides additional information.

East Container Storage Area – Run-on Run-off is prevented in the East Container Storage Area by curbing that is a minimum of 5.5 inches above the surrounding grade to prevent run-on/run-off from the unit.

Lab Depack Area – The Lab Depack Area is located inside a building with a roof and doors to prevent precipitation and runoff from the unit. The finished floor of the unit is above natural grade and the unit is accessed by a concrete ramp which mitigates the potential for run-on at the unit. Storage of hazardous waste in the Lab Depack area is conducted in Portable Secondary Containment Pallets. These manufactured devices are typically constructed with sides of sufficient height to prevent contact from run-on/run-off at the unit. Section D, Appendix D-H provides technical information for typical secondary containment pallets.

Bulk Loading Area (Tanker and Rail) – The Bulk Loading Area (Tanker and Rail) secondary containment volume is sufficient to contain precipitation from a 25-year/24-hour storm event, including any run-on into the unit, based on land surveying conducted to determine the drainage area in the vicinity of the adjacent DVSA. Accumulated precipitation or other liquids found in the containment are removed within one operating day of discovery. Section D, Appendix D-E provides additional information.

Metal grates over the sump minimize run-on into the sump. To the west of the rail spur, there is an 18-inch-high wall to minimize run-on into the unit. Where there is a gap in the wall and grating over additional containment for the rail area, that grating is raised, preventing run-on into the unit from the dock area. To the south of the rail spur, there is an end-loading dock for railcars. This dock is raised and sloped away from the rail area, preventing run-on or run-off. The tanker truck bay is sloped from the south and from the north toward the sump to minimize run-off from the area. To the east of the tanker truck bay, the unit is bordered by walls. Therefore, there is no run-on or run-off at the east side of the unit.

800 Area Container Storage – The 800 Container Storage Area is located inside a building with roof and doors to prevent precipitation and significantly limit the potential for run-off or accumulated precipitation. Storage of hazardous waste in the 800 Area Container Storage is conducted in Portable Secondary Containment devices. These manufactured devices are typically constructed with sides of sufficient height to prevent contact with hazardous waste from potential run-on/run-off. Section D, Appendix D-H provides technical information for typical secondary containment pallets.

4.3 Power Failure

In the case of a power failure, the facility may have to cease operations, but there would be no threat of a release or endangerment to human health or the environment. Ingress/egress to the facility would be via the manually controlled gates or the main gate, which can also be manually opened. A list of emergency lighting units is included with the emergency equipment list in Appendix G-D of the Contingency Plan.

4.3.1 Fire Suppression Capability

The fire suppression system in the Central Storage Area and the 800 Area Container Storage Area is equipped with a rated fire pump powered by a diesel engine. The diesel fire pump is designed to operate with or without power either automatically or in manual mode.

In the event of a power outage during a fire, the fire hydrant feed pump system will not operate because there is no backup power source. The fire department has access to the fire water supply through the hydrants (the City of Coolidge pumper trucks have the capability to suck water from hydrants) as well as from a central draw-point. The pumper trucks will then boost the pressure for direct fire-fighting purposes.

The well pump will also not operate when the power is out and will not be able to refill the water tanks. In this case, the facility will be limited to the stored volume of water (126,900 gallons) at the facility before water from offsite is required. The Coolidge Fire Department is in the process of acquiring new equipment that will significantly reduce the water requirements of their pumper trucks.

The loss of power will have no effect on the use of the four foam canisters, as these are educted by the fire trucks. Also, the loss of power will have no effect on using hand-held extinguishers.

4.4 Personnel Protective Equipment

The facility prevents undue exposure of personnel to hazardous waste by installing engineering controls, implementing administrative measures, or providing employees with the appropriate personal protective equipment. Heritage provides eye protection (e.g., safety glasses), foot protection (steel-toed boots), dermal protection (coverall, gloves, aprons, uniform, etc.), and breathing protection (e.g., air purifying respirator) which is selected based on the task or activity being performed and the conditions associated with the task being performed. In addition, Heritage provides thorough medical monitoring for employees. The medical monitoring program is managed by an industrial hygienist and Heritage occupational health physicians.

4.5 Minimize Release to the Atmosphere

Waste management activities are conducted in a manner to minimize the exposure to the atmosphere by engineering controls and by conducting activities under roof, when possible. Solids (filter cake) blending operations do not take place in windy conditions. If deterioration or leaks are detected during container inspections, the container is immediately overpacked.

4.6 Management of Temperature Sensitive Materials

Heritage prohibits certain wastestreams that are considered temperature sensitive from being accepted at the facility during the months of June through September when average

daily high temperatures in the Phoenix area exceed 100° F. Wastestreams that generators identify as temperature sensitive, shock sensitive, spontaneously combustible, or requiring temperature controls undergo an additional technical review prior to approval to consider whether or not the materials can be accepted at the facility during the months of June through September.

Wastes that will normally be prohibited from acceptance to the facility during months of June through September will consist of the following:

- Wastestreams that generators identify on the Heritage wastestream profile as being temperature sensitive, requiring temperature controls, or are shock sensitive with self-accelerating decomposition temperatures that are less than 122° F (50° C). 5 IGNITABLE, REACTIVE AND INCOMPATIBLE WASTE

5.1 Prevention of Ignition or Reaction

Smoking is allowed in designated areas only. "NO SMOKING" signs are posted throughout the facility. Any work that involves open flames or other sources of heat (*e.g.,* welding, cutting, etc.) must be accompanied by a Heritage-issued Safe Work Permit. Water reactive wastes will only be stored in the Lab Depack Area. When water reactive wastes are in transit on a trailer, the trailer will be placarded accordingly.

5.2 General Handling Precautions

The procedures to be followed prior to consolidating different wastestreams are specified in the facility's Waste Analysis Plan (Section C) and in facility SOPs.

5.3 Screening Solids (Filter Cake) Prior to Blending

Wastestreams designated for the Solids (Filter Cake) Blending program are initially screened for cyanide, volatile organic compounds, and free liquids. Additional details are provided in the Waste Analysis Plan (Section C).

5.4 Management in Containers

Containers of ignitable or reactive waste are located at least 50 feet (15 meters) from the facility's property line. See the Container Storage and Consolidation Plan (Permit Section D) for applicable drawings. Incompatible wastes and materials are not placed in the same container or in unrinsed containers that previously held incompatible wastes. Incompatible materials will not be stored in a railcar and a tanker truck simultaneously in the Bulk Loading Area. Storage of incompatible containers is addressed in the Container Storage and Consolidation Plan (Section D).

5.5 Fire Detection Devices

The facility is equipped with automated fire detection devices in the Central Container Storage Area, the 800 Area Container Storage Area, the Dock and Van Container Storage Area, and the Rail and Tanker Loading Area, as well as other areas of the facility. Depending on their location, these automated devices are designed to detect a pressure loss indicating that automated fire suppression equipment was engaged, detect heat in excess of 190^{o} F, detect smoke using beam detection systems, or detect smoke by photoionization devices. Manual pull-down fire alarms are also present at the facility. When engaged, these devices activate internal horns/strobe lights and automatically notify a third-party alarm-monitoring company. Additional information is provided in Appendix D-B.

APPENDIX D-A

FACILITY INSPECTION INFORMATION

CONTAINER AND CONTAINMENT INSPECTION

Containers will be inspected for leaks, deterioration, and presence of labeling on a daily basis. The frequency of inspection for the structure and ancillary items in the container storage areas, [e.g., containment system, trenches, and sumps (for liquids), and concrete base, berms and walls (for Hazardous roll-off storage)], will be weekly. Additional information is available in Section 2 – Inspection Schedule and in the Container Storage and Consolidation Plan (Section D).

SAFETY AND EMERGENCY EQUIPMENT INSPECTION

At a minimum frequency of once per week, emergency equipment identified in the Contingency Plan will be inspected to identify that the items are present and in working order. In addition, safety equipment identified in Table G-A will be inspected at the frequency noted in Table G-A.

MONTHLY SECURITY INSPECTION

At a minimum frequency of once per month, the following security items will be checked:

- Fencing in good condition
- Fence-line berms in good condition (i.e., sufficient sandy clay loam content for structural integrity to prevent stormwater run-on/run-off) with minimum height of 1.5 feet
  * (in addition to monthly, check integrity after any storm event greater than 1 inch)
- Danger signs posted
- Automatic gates operational

ANNUAL SAFETY MONITORING EQUIPMENT/ COATING/ SPRINKLER INSPECTION

At a minimum frequency of once per year, the fire suppression systems at the Central Container Storage Area and the 800 Storage Area will be inspected to confirm that they are in working order. The components that will be inspected include the automatic sprinkler systems, the pumping systems that feeds the sprinkler system, and the fire hydrants. The pressure gauges will be inspected for malfunction or calibration drift.

SUBPART BB INSPECTION AND REPAIRS

Refer to Subpart BB Air Emissions Standards for Equipment Leaks (Section N) for more information. At a minimum frequency of once per week, the following equipment will be inspected:

SUBPART CC INSPECTION

At a minimum, containers will be visually inspected for cracks, holes, gaps, or other spaces into the interior of the container as required in 40 CFR Part 264, Subpart CC. Refer to the Subpart CC Inspection and Monitoring Plan (Section O) for more information.

- If waste is added to a container at the facility, the initial inspection must be performed promptly upon adding waste to the container.
- If waste is already in the container, the initial inspection must be performed at the time the container is being accepted at the facility.
- If a container remains at the facility for a period of one year or more, the visual inspection must be repeated once every 12 months.

CHECKLISTS

Heritage maintains checklists documenting inspections of each area subject to daily, weekly, monthly, and annual inspections. Samples of these checklists are provided in the following pages. An entry will be made on the relevant checklist for each item subject to inspection and will include the printed name and signature of the inspector and the date of the inspection.

ADMIXTURES CONTAINING CHLORIDES SHALL NOT BE USED. NO OTHER ADMIXTURES PERMITTED WITHOUT APPROVAL. FOR CONCRETE WITHOUT PLASTICIZER, MAXIMUM SLUMP 4 1/2" AT POINT OF PLACEMENT U.N.O. IF PLASTICIZER IS USED, A HIGHER FINAL SLUMP MAY BE ALLOWED UPON STRUCTURAL ENGINEER'S APPROVAL.

FOR REINFORCING INFORMATION, SEE REINFORCING SECTION OF G.S.N., PLANS, SCHEDULES AND DETAILS.

UNLESS NOTED OTHERWISE ON THE DRAWINGS, THE EMBEDMENT OF CONDUITS, PIPES, SLEEVES, ETC. OF ANY MATERIAL SHALL NOT BE PERMITTED WITHIN ANY CONCRETE STRUCTURAL ELEMENT (IE: COLUMNS, BEAMS, ELEVATED SLABS, ETC.) OR STRUCTURAL CONCRETE TOPPINGS WITHOUT THE EXPRESSED APPROVAL OF THE STRUCTURAL ENGINEER.

TEST DATA FOR EACH CONCRETE MIX SHALL BE SUBMITTED FOR REVIEW PER CHAPTER 5 OF ACI 318. REFERENCE FIGURE R5.3 FOR SUBMITTAL REQUIREMENTS AND OPTIONS. CONCRETE MIX DESIGNS THAT ARE SUBMITTED WITHOUT THE APPROPRIATE TEST DATA CANNOT BE REVIEWED.

SLABS ON GRADE SHALL BE VIBRATED ONLY AT TRENCHES, FLOOR DUCTS, TURNDOWNS, ETC. CAST CLOSURE POUR AROUND COLUMNS AFTER COLUMN DEAD LOAD IS APPLIED. UNLESS APPROVED OTHERWISE IN WRITING BY THE ARCHITECT, ALL CONCRETE SLABS ON GRADE SHALL BE BOUND BY CONTROL JOINTS (CONSTRUCTION OR SAW CUT) PER TYPICAL DETAILS, AS SHOWN ON THE FOUNDATION PLAN, SUCH THAT THE ENCLOSED AREA DOES NOT EXCEED 150 SQUARE FEET. CONSTRUCTION CONTROL JOINTS NEED ONLY OCCUR AT EXPOSED EDGES DURING POURING, ALL OTHER JOINTS MAY BE SAW CUT. SLAB REINFORCING, WHERE SHOWN, SHALL NOT EXTEND MORE THAN 125 FEET WITHOUT STOPPING THE REINFORCEMENT AT A CONTROL JOINT.

CONTROL JOINTS SHALL NOT OCCUR AT WALL CORNERS, INTERSECTIONS, ENDS, WITHIN 24" OF CONCENTRATED POINTS OF BEARING OR JAMBS, OR OVER OPENINGS UNLESS SPECIFICALLY SHOWN ON THE STRUCTURAL DRAWINGS. ALL MASONRY BELOW FINISHED FLOOR OR GRADE SHALL BE GROUTED SOLID.

STRUCTURAL STEEL:

ANCHOR RODS:

ANCHOR RODS INCLUDE HOOKED, HEADED, AND THREADED AND NUTTED ANCHORS. THE TERMS ANCHOR BOLT AND ANCHOR ROD ARE USED SYNONYMOUSLY THROUGHOUT THESE DOCUMENTS. ALL ANCHOR ROD MATERIAL SHALL BE PER ASTM F1554 GRADE 36. A307 ANCHOR RODS MAY BE SUBSTITUTED FOR ASTM F1554 GRADE 36 AT CONTRACTOR'S OPTION. ALL ANCHOR RODS SHALL BE INSTALLED WITH STEEL WASHERS AT OVERSIZED ROUND HOLES USING SNUG TIGHT INSTALLATION, UNLESS NOTED OTHERWISE.

THE ANCHORING MECHANISM FOR NUTTED ANCHOR RODS SHALL CONSIST OF DOUBLE NUTS WITH A WASHER BETWEEN. THE NUTS AND WASHER ARE TO BE EMBEDDED INTO THE CONCRETE PER THE DETAILS AND PLANS. THE WASHER SHALL BE 1/4"X4"X4" U.N.O. THE CONTRACTOR SHALL PREVENT THE NUTS FROM SPINNING OFF DURING THE VIBRATION OF THE CONCRETE. THIS COULD BE ACCOMPLISHED BY TIGHTENING THE NUTS AGAINST EACH OTHER THEREBY LOCKING THEM IN PLACE OR BY TACK WELDING EACH NUT TO THE ANCHOR ROD.

WHERE THE ANCHORS ARE TO BE GALVANIZED, THE ANCHOR ROD AND THE NUTS SHALL BE GALVANIZED WITH THE SAME PROCESS TO ENSURE THE THREADS MATCH.

AT CONTRACTOR'S OPTION HEADED ANCHORS PER ABOVE MAY BE SUBSTITUTED FOR CONVENTIONAL ANCHORS AND MACHINE BOLTS (REVERSE SUBSTITUTION NOT ALLOWABLE).

FRAMING:

ALL WELDING TO BE PERFORMED BY WELDERS HOLDING A VALID CERTIFICATE AND HAVING CURRENT EXPERIENCE IN LIGHT GAUGE STEEL. CERTIFICATES SHALL BE ISSUED BY AN ACCEPTED TESTING AGENCY. DO NOT NOTCH FLANGES OF MEMBERS WITHOUT EXPRESSED APPROVAL OF THE ENGINEER OF RECORD. ALL WELDING TO BE PERFORMED IN AN APPROVED FABRICATORS SHOP.

COLD FORMED STRUCTURAL STEEL MEMBERS SHALL HAVE A MINIMUM YEILD STRENGTH OF Fy = 55,000 PSI. COLD FORM STRUCTURAL STEEL SHALL BE GALVANIZED PER ASTM A653 WITH A MINIMUM COATING DESIGNATION OF G90. IT IS ACCEPTABLE TO USE THE Fy SHOWN ON THE MILL CERTIFICATION IN LIEU OF THE "ORDERED" Fy.

THE STEEL PURLINS DO NOT HAVE TO BEAR DIRECTLY ON THE MASONRY WALL. IT IS ACCEPTABLE AND COMMON FOR THE PURLINS TO NEED TO BE RAISED A LITTLE (1/2" MAXIMUM) TO ASSIST IN LEVELING AND 'TUNING' THE STRUCTURE. THE LOAD BETWEEN THE PURLIN AND THE WALL IS TRANSFERRED ENTIRELY THROUGH THE SCREWS CONNECTING THE PURLIN TO THE PURLIN CLIP. THE PURLIN DOES NOT NEED TO BEAR ON THE WALL.
