Subject:

First Semiannual 2024 Groundwater Monitoring Report
SFPP, L.P. – Silvercroft Wash Release Site, Tucson, Arizona
Site Code: 506251-00

Dear Ms. Osuch:

Arcadis U.S., Inc. (Arcadis) has prepared the attached *First Semiannual 2024 Groundwater Monitoring Report* for the above-referenced site on behalf of SFPP, L.P., an indirect subsidiary of Kinder Morgan, Inc. (Kinder Morgan).

If you have any questions regarding the contents of the attached document, or require additional information, please contact Alan Van Antwerp at (619) 922-1960.

Sincerely,

Arcadis U.S., Inc.

Robert Forsberg, R.G.
Principal Geologist

# 1 Introduction

Arcadis U.S., Inc. (Arcadis) has prepared this *First Semiannual 2024 Groundwater Monitoring Report,* on behalf of SFPP, L.P. (SFPP), an indirect subsidiary of Kinder Morgan Inc. (Kinder Morgan), for the SFPP Silvercroft Wash Release Site in Tucson, Arizona (the site; Figure 1). This report summarizes field activities, groundwater elevation data, apparent free product thickness measurements, groundwater analytical data, and soil remediation status for the first and second quarter of 2024.

# 2 Background

## 2.1 Site Location

The site is located west of the I-10 Freeway, north of Grant Road, along Silvercroft Wash, in the City of Tucson (COT), Pima County, Arizona. The site lies in the Northwest 1/4 of the Southwest 1/4 of the Northwest 1/4 of Section 34, Township 13 South, Range 13 East, as shown on the Jaynes, Arizona 7.5 Minute United States Geological Survey Topographic Quadrangle (Figure 1). The site lies at an elevation of approximately 2,290 feet above mean sea level (amsl). Groundwater monitor wells are located within the Silver Creek I and Silver Creek II subdivisions, with some wells located in the buffers between the subdivisions and Silvercroft Wash. The land surrounding MW-28 is under development with new residential housing and construction activities are ongoing.

## 2.2 Hydrogeologic Setting

The site is located along the northeastern margin of the Tucson Basin, a broad northwest-trending alluvial valley encompassing approximately 1,000 square miles. The Tucson Basin is defined as the portion of the upper Santa Cruz drainage system bounded on the north and northeast by the Tortolita and Santa Catalina Mountains, on the east by the Rincon and Empire Mountains, and on the west by the Black, Tucson, and Sierrita Mountains (Tucson Water 1988). The central portion of the Tucson area is filled by a large fluvial/alluvial deposit representing two coalescing deposits originating from the Santa Cruz River, located approximately 600 feet east of the subject property, and the Rillito Creek, located approximately 3 miles north of the site (Davidson 1973). Both streams are ephemeral and only contain water during heavy rainfall. The total thickness of the alluvial deposits is estimated to be over 20,000 feet (Tucson Water 1988).

Quaternary alluvium deposits originating from the coalescing streams underlie the site to an approximate depth of 35 to 50 feet below ground surface (bgs). The Fort Lowell Formation is composed of gravel near the basin margins and grades to silt near the center. The formation ranges in thickness from 300 to 400 feet, thinning toward the basin margins (Davidson 1973), and is estimated to be 35 feet thick near the vicinity of the site (Tucson Water 1988). The Tertiary Tinaja beds rest unconformably (deposited over a weathered surface, or after a period of non-deposition) below the Fort Lowell Formation and are composed of gravel and sand grading to a very thick sequence of gypsiferous clayey silt and mudstone toward the center of the basin (Davidson 1973). These beds were deposited in an internally draining basin and are estimated to be several thousand feet thick near the center (Davidson 1973). The Upper Tinaja Subunit of the Tinaja Formation underlies the Fort Lowell Formation and is believed to be 300 to 400 feet thick in the site vicinity (Tucson Water 1988). The Upper Tinaja

beds are comprised of moderate to well consolidated sandy, gravelly silt and clays, and overly volcanic bedrock (Davidson 1973).

The regional aquifer underlying the Tucson Basin consists of three primary water-bearing units. These units, in descending stratigraphic order, are the Quaternary Age Fort Lowell Formation, the Tertiary Tinaja Beds, and the Tertiary Pantano Formation. The Fort Lowell Formation is the most productive part of the aquifer. Recent Quaternary surficial deposits overlie these formations. These surficial deposits are typically gravel and gravelly sand with local sand and sandy silt, and range in thickness from a thin veneer to tens of feet (Davidson 1973).

Lithologies encountered during drilling of all wells associated with the SFPP release have consisted of coarse sands and gravels to 175 feet bgs. Groundwater was initially encountered at approximately 140 feet bgs in all borings. No perched groundwater was detected in the borings. Silt or clay lenses were not encountered between the surface and the groundwater table, with soil samples logged at 5-foot intervals in wells at and near the release point, and at 10-foot intervals in wells away from the release point (Arcadis 2017).

# 3 Description of Field Activities and Methods

## 3.1 Status of Free Product Extraction

Extraction of free product was first initiated on October 29, 2003. Product extraction halted after the second week in July 2006. A letter was submitted to the Arizona Department of Environmental Quality (ADEQ) Voluntary Remediation Program on February 8, 2007, notifying them of product recovery termination and changing the groundwater monitoring frequency from monthly to quarterly. On February 13, 2007, an email was received from ADEQ approving the discontinuation of free product extraction and changing the groundwater sampling frequency from monthly to quarterly.

Figures illustrating the historic volume of product removed per week and cumulative product removed are included in quarterly reports through the fourth quarter of 2007.

## 3.2 2013 Well Installation

Six groundwater monitoring wells, MW-27, MW-28, MW-29S, MW-29M, MW-29D, and MW-30, were drilled, installed, and developed by mid-December 2013 in accordance with the Monitoring Well Installation and Sampling Work Plan (Work Plan) dated October 21, 2013 (Arcadis 2013). Groundwater monitoring wells MW-27 and MW-28 were installed within 500 feet of the west side of the COT Silverbell Landfill; three clustered wells (MW-29S, MW-29M, and MW-29D) were installed within 100 feet of the COT Silverbell Landfill; and one well (MW-30) was installed within 500 feet of the south of the COT Silverbell Landfill. The six new monitoring wells were added to the existing site monitoring well network and were incorporated into the quarterly monitoring events beginning with the first quarter of 2014. The well installation and development are discussed in further detail in the Groundwater Monitoring Well Installation Report, which was issued under separate cover and appended to the First Quarter 2014 Groundwater Monitoring Report dated May 14, 2014 (Arcadis 2014).

## 3.3 2020 Well Installation

Five groundwater monitoring wells, MW-31M, MW-31D, MW-32S, MW-32M, and MW-32D, were drilled, installed, and developed in November 2020. The five new monitoring wells were installed as part of the air sparge pilot test. The wells have been added to the existing site monitoring well network and were incorporated into the quarterly monitoring events beginning with the first quarter of 2022.

## 3.4 Groundwater Elevation Data Collection

Arcadis collected depth to groundwater and depth to free product measurements monthly using an electronic interface probe. Measurements are collected from the 32 Kinder Morgan groundwater monitoring wells and 10 COT monitoring wells located on and near the site (Figure 2). Groundwater elevations are then calculated by subtracting the depth to water from the surveyed top of casing measuring point. Groundwater elevations are included in Table 1.

## 3.5 Groundwater Sample Collection

Due to the declining water table at the site, numerous wells would go dry before a three-volume purge could be reached prior to sampling. During a meeting with ADEQ in September 2013, it was discussed and approved by ADEQ that all wells will be sampled by low flow purging technique moving forward. The newly installed wells (MW-27 through MW-30) were first sampled by low flow purge and then three-volume purge method for comparison in accordance with ADEQ request. During a meeting with ADEQ on September 24, 2014, it was requested to remove groundwater monitoring wells MW-3, MW-7 through MW-12, MW-15, and MW-23 from the quarterly sampling events. In addition to the reduced wells, it was also requested to remove the three-volume purge from the newly installed wells moving forward. ADEQ approved the request in an e-mail response dated September 26, 2014. A copy of the ADEQ approved request is provided in Appendix A.

As discussed in the Remedial Investigation Responsiveness Summary (Appendix C of the Final Remedial Investigation Report, Silvercroft Wash Release Site, Tucson, Arizona, Site Code: 506251-00), Kinder Morgan coordinated with the COT to add three additional monitor wells (R-079A, R-082A, and WR-093A) to the monitoring network. ADEQ approved of the addition of these three wells to continue to evaluate the downgradient extent of benzene, toluene, ethylbenzene and total xylenes (BTEX) and methyl tertiary-butyl ether (MTBE) in their approval letter of the Fourth Quarter 2016 Groundwater Monitoring Report dated March 21, 2017. A copy of the ADEQ approval is provided in Appendix A.

Per an access agreement completed on July 23, 2019 with the COT, Arcadis was granted access to sample monitor wells A-039A, R-067A, R-079A, R-082A, R-122A, WR-093A, WR-242A, WR-359A, WR-430A, WR-463A, WR-464A, and WR-467A. Monitor well A-039A was not sampled due to an obstruction downhole.

Arcadis collected groundwater samples from February 29 to March 13, 2024 and from May 14 to May 23, 2024. Wells were sampled in order, from least impacted to most impacted, based on available historical data.

### 3.5.1 Low-Flow Purging

The monitoring wells were purged at approximately 300 milliliters per minute (ml/min) per the low-flow sampling method until monitoring parameters (temperature, pH, conductivity, dissolved oxygen [DO], oxidation reduction

potential [ORP], and total dissolved solids [TDS]) stabilized. Parameters were monitored with an YSI 556 Multi-Parameter System with a flow through cell. Parameters were recorded approximately every five minutes on field data sheets.

Arcadis also performed analysis of ferrous iron and sulfite in the field immediately after sample collection utilizing a Hach® DR820 spectrometer and a Hach® SU-5 Sulfite Test Kit, respectively. The Hach® SU-5 Sulfite Test Kit utilizes a drop count titration method. Ferrous iron and sulfite readings were recorded on the field data sheets. Field data sheets are attached in Appendix B.

A 2-inch diameter Bennet™ low flow sampling pump was used to purge each well. The pump's intake was placed at the approximate center of the saturated screen interval (the midpoint of the well depth and measured depth to water) in each well. Each well was purged at approximately 300 ml/min. Upon stabilization of the water quality parameters, the purge flow rate was reduced to approximately 100 ml/min, the flow-through cell was disconnected, and the groundwater sample was collected from the outlet of the dedicated sample tubing.

Groundwater samples were collected directly into laboratory-supplied sample bottles. The sample bottles were then immediately placed into a cooler containing wet ice to maintain the samples at approximately 4 degrees Centigrade (ºC). Samples were picked up from Arcadis by a representative of Pace Analytical National (Pace) and delivered via Federal Express to Pace in Mount Juliet, Tennessee daily. Pace analyzed the samples for volatile organic compounds (VOCs) in accordance with United States Environmental Protection Agency (USEPA) Method 8260. Arcadis also collected sample bottles for laboratory analysis of the following monitored natural attenuation (MNA) parameters: total iron, nitrate, nitrite, sulfate, TDS, ethane, ethene, and methane.

Purged water was collected into 5-gallon plastic buckets with lids, and then transferred to the on-site sump. The purge water was pumped from the sump through two 55--gallon carbon vessels, and then discharged into the COT sewer system in accordance with Pima County Wastewater Management Department industrial wastewater discharge permit #12821.

# 4 Groundwater Monitoring Results

## 4.1 Free Product Apparent Thickness

No free product has been detected in monitoring wells at the site since the fourth quarter of 2014 (Appendix C). Figures 3 and 4 illustrate the apparent free product thickness vs. time on the east and west sides of Silvercroft Wash, respectively.

## 4.2 Groundwater Elevation Data

Table 1 displays monthly groundwater elevations collected throughout the first and second quarter of 2024. Cumulative groundwater elevations and apparent free product data are tabulated in Appendix C.

Depth to groundwater measurements collected during the first quarter (March) of 2024 ranged from 145.06 feet bgs in well WR-463A to 172.81 feet bgs in well WR-359A. Depth to groundwater measurements collected during the second quarter (May) of 2024 ranged from 144.65 feet bgs in well MW-19 to 171.00 feet bgs in well WR-359A. As shown on Figure 5, water levels beneath the site had steadily declined in response to the regional drought since monitoring began in October 2003 until September 2014. From September 2014 through February

2020, water levels generally increased across the site. From July 2020 through September 2022, water levels generally decreased across the site. Since September 2022, water levels have generally increased. Seasonal fluctuations are evident with lower elevations in summer months and higher elevations in winter months.

The groundwater elevation maps for March 2024 are shown on Figure 6 and for May 2024 are shown on Figure 7. Groundwater flow is generally to the northwest.

## 4.3 VOC Analytical Results

### 4.3.1 Shallow Wells

During the first quarter (March) and second quarter (May) sampling events of 2024, Arcadis collected groundwater samples from 22 shallow Kinder Morgan and 10 COT monitor wells. Groundwater samples were analyzed for BTEX, tert-butyl alcohol (TBA), MTBE, and chlorinated VOCs in accordance with USEPA Method 8260B. Analytical results for the first and second quarters 2024 sampling event are summarized in Table 2 and plotted on Figure 6 and 7. Benzene, MTBE, and screen intervals are plotted on Figure 8 and 9. Cumulative analytical data of monthly sampling events dating back to October 2003 are included in Appendix D. The following discussion of the analytical results is based on the results from the low-flow purge samples during the first and second quarters of 2024.

#### 4.3.1.1 First Quarter 2024 Results

During the first quarter 2024 sampling event, analytical results for the sampled SFPP wells were either non-detect or below aquifer water quality standards (AWQS) for BTEX. BTEX was either non-detect below the laboratory reporting limit or below AWQS in the SFPP sampled COT wells. Reporting limits for samples MW-26, MW-29S, and MW-32S were elevated due to dilution for analyses. The plume of dissolved-phase BTEX above AWQS remains delineated to the south, west, east, and north.

There is no AWQS for MTBE. The ADEQ Underground Storage Tank (UST) Program Interim Policy for MTBE in groundwater set forth a threshold for delineation of dissolved-phase MTBE of 20 µg/L. As explained in Section 9.3 of the Final Consolidated and Updated Proposed Remediation Work Plan SFPP L.P. – Silvercroft Wash Release Site Tucson, Arizona (FCUPRWP; LFR 2005), the mechanism of groundwater flushing due to heavy winter precipitation would be expected to seasonally elevate MTBE concentrations in downgradient wells, with seasonal decreases expected through the summer and fall. Thus, according to the ADEQ-approved FCUPRWP, MTBE concentrations in a delineation well must persist above the 20 µg/L level for four consecutive quarters before additional downgradient delineation wells need to be considered. As stated in the FCUPRWP, in the event that the above processes result in increases in dissolved-phase concentrations above delineation levels in SFPP downgradient wells, SFPP will first coordinate with the COT and/or other well owners to sample wells further downgradient of the point of release. SFPP added monitor wells R-079A, R-082A, and WR-093A to the sampling program in April 2017.

MTBE was detected above the 20 µg/L level in SFPP wells MW-29S (19,100 µg/L) and MW-32S (4,900 µg/L). MTBE was detected above the 20 µg/L level in COT wells R-067A (85.5 µg/L), WR-359A (313 µg/L), WR-430A (857 µg/L), and WR-464A (27.3 µg/L). The plume of dissolved-phase MTBE remains delineated to the south, west, east, and north.

TBA was detected above laboratory reporting limits in SFPP wells MW-02 (22.7 µg/L), MW-04 (41.3 µg/L), MW-05 (5.19 µg/L), MW-13 (6.82 µg/L), MW-19 (7.4 µg/L), MW-21 (22.9 µg/L), and MW-26 (805 µg/L). TBA was detected above laboratory reporting limits in COT wells R-067A (14,600 µg/L), R-122A (5.74 µg/L), WR-359A (26,800 µg/L), WR-430A (1,880 µg/L), and WR-464A (142 µg/L). There is no AWQS established for TBA.

During the first quarter of 2024, tetrachloroethene (PCE) concentrations above laboratory reporting limits in SFPP wells MW-27 (2.13 µg/L) and MW-28 (16.6 µg/L). The AWQS for PCE is 5 µg/L. Trichloroethylene (TCE) concentrations were detected in well MW-28 (2.16 µg/L), however, this concentration did not exceed the AWQS of 5 µg/L for TCE. The PCE and TCE are likely from one or more landfills in the vicinity. The SFPP pipelines carry fuels only; therefore, the pipeline release could not have been a source of PCE or TCE.

SFPP has been including dichlorodifluoromethane and cis-1,2-dichloroethene (cis-1,2-DCE) groundwater analytical results (Table 2) to assist COT and ADEQ with their evaluation of nearby landfill source(s) of chlorinated volatile organic compounds (CVOCs). During the first quarter of 2024, dichlorodifluoromethane and cis-1,2-DCE were not detected in the groundwater samples above laboratory reporting limits from the SFPP wells. The AWQS for cis-1,2-DCE is 70 µg/L. There is no AWQS established for dichlorodifluoromethane.

#### 4.3.1.2 Second Quarter 2024 Results

During the second quarter 2024 sampling event, analytical results for the sampled SFPP wells were either non-detect or below AWQS for BTEX. BTEX was either non-detect below the laboratory reporting limit or below AWQS in the SFPP sampled COT wells. Reporting limits for samples MW-29S, MW-32S, R-067A, and WR-430A were elevated due to dilution for analyses. The plume of dissolved-phase BTEX above AWQS remains delineated to the south, west, east, and north.

MTBE was detected above the 20 µg/L level in SFPP wells MW-29S (16,200 µg/L) and MW-32S (103 µg/L). MTBE was detected above the 20 µg/L level in COT wells R-067A (124 µg/L), WR-359A (185 µg/L), WR-430A (416 µg/L), and WR-464A (27.8 µg/L). The plume of dissolved-phase MTBE remains delineated to the south, west, east, and north.

TBA was detected above laboratory reporting limits in SFPP wells MW-04 (32.0 µg/L), MW-22 (8.04 µg/L), MW-26 (388 µg/L), and MW-27 (6.30 µg/L). TBA was detected above laboratory reporting limits in COT wells R-067A (11,300 µg/L), WR-359A (19,300 µg/L), WR-430A (2,750 µg/L), and WR-464A (191 µg/L). There is no AWQS established for TBA.

During the second quarter of 2024, PCE concentrations above laboratory reporting limits in SFPP wells MW-27 (1.96 µg/L) and MW-28 (13.7 µg/L). The AWQS for PCE is 5 µg/L. TCE concentrations were detected in well MW-28 (1.74 µg/L), however, this concentration did not exceed the AWQS of 5 µg/L for TCE. The PCE and TCE are likely from one or more landfills in the vicinity. The SFPP pipelines carry fuels only; therefore, the pipeline release could not have been a source of PCE or TCE.

During the second quarter of 2024, dichlorodifluoromethane and cis-1,2-DCE were not detected in the groundwater samples above laboratory reporting limits from the SFPP wells. The AWQS for cis-1,2-DCE is 70 µg/L. There is no AWQS established for dichlorodifluoromethane.

### 4.3.2 Intermediate and Deep Wells

The intermediate (MW-29M, MW-31M, MW-32M) and deep (MW-29D, MW-31D, MW-32D) wells were not sampled during the first and second quarters of 2024 due to on-going air sparging.

## 4.4 MNA Parameter Results

Figure 10 illustrates the general evolution of groundwater quality as bioattenuation progresses (Interstate Regulatory Council et al 2005). Bacteria will preferentially utilize electron acceptors in the general order of the energy that may be obtained. The order of terminal electron accepting processes and the associated changes in constituents are:

1. Aerobic respiration (utilization of oxygen/decrease of dissolved oxygen)
2. Denitrification (utilization of nitrate/decrease in nitrate)
3. Iron (III) reduction (increase in ferrous [II] iron)
4. Sulfate reduction (decrease in sulfate, increase in hydrogen sulfide)
5. Methanogenesis (increase in methane).

Arcadis collected DO, ORP, ferrous iron, and sulfite readings in the field during the third and fourth quarters 2023 sampling event. These data are displayed in Table 3. The groundwater samples were analyzed in the laboratory for total iron, TDS, nitrate, nitrite, sulfate, and methane. These data, shown in Table 4, allow evaluation of effectiveness of the mechanisms of denitrification, sulfate reduction, and methanogenesis.

During the first quarter 2024 sampling event, the ORP probe was not functioning correctly during field measurements. All wells exhibited a negative ORP reading between -412.2 and -286 millivolts, which is inconsistent with historic data (Table 3). A contour plot of DO measurements from the event is shown on Figure 11. DO measurements recorded from each well ranged from 0.80 milligrams per liter (mg/L) in well MW-19 to 7.85 mg/L in well MW-22 (Table 3).

During the second quarter 2024 sampling event, negative ORP readings were recorded in 4 of 31 wells measured (Table 3). Negative ORP readings indicate that attenuation by microorganisms is resulting in anaerobic conditions. A contour plot of DO measurements from the event is shown on Figure 12. DO measurements recorded from each well ranged from 3.00 mg/L in well MW-04 to 15.6 mg/L in well WR-359A (Table 3).

Active air sparging at MW-29M, MW-29D, MW-31M, MW-31D, MW-32M, and MW-32D is ongoing. As discussed in previous reports, lower DO values noticeable outside of the hydrocarbon-impacted area are suggestive of landfill impacts to groundwater in this vicinity. TDS, nitrate, and sulfate contours are shown for the third quarter 2023 on Figures 13, 15, and 17, respectively. TDS, nitrate, and sulfate contours are shown for the fourth quarter 2023 on Figures 14, 16, and 18, respectively. Nitrate concentrations are generally lower in the plume area further indicating aerobic degradation is occurring. As shown on the figures, wells in the northern part of the study area generally have the highest TDS and sulfate (concentrations, further supporting the interpretation of landfill impacts to groundwater in this vicinity.

## 4.5 Sparge System Performance

### 4.5.1 Sparge System Operation

Operation of the air sparge system began following completion of the pilot test in June 2022. The system was operational for approximately 82 percent of the time (3,586 hours) between January 1 and June 30, 2024. Quarterly sampling of the existing monitoring well network was conducted to evaluate performance of the sparge

system. Since the aerobic degradation of benzene is faster than MTBE, dissolved-phase MTBE concentrations and dissolved oxygen levels in groundwater are evaluated as an indicator of the remedial effectiveness of the air sparge system operations. Hydrographs showing dissolved-phase MTBE and DO versus time in monitor wells MW-29S and MW-32S are included in Figures 19 and 20, respectively. As indicated in these hydrographs, when dissolved oxygen concentrations increased, MTBE concentrations have generally decreased indicating air sparging is effectively enhancing remediation of dissolved-phase MTBE in groundwater.

# 5 Quality Assurance/Quality Control

This section describes the measures taken to control and document the quality of the environmental samples collected during this investigation. Elements of quality assurance/quality control (QA/QC) procedures include the methods used in equipment decontamination; appropriate sample preservation, containers, labeling, shipment and chain-of-custody (COC) protocols; collection of field QA/QC samples; and laboratory QA/QC procedures.

Standardized field procedures such as well gauging, well purging, and sample handling are described in Sections 3.4 and 3.5 of this report. Field QA/QC samples including duplicates, equipment blanks, and trip blanks are described in Section 5.6.

## 5.1 Equipment Decontamination

During the low-flow sampling, all sampling equipment (pump and ancillary equipment) was properly decontaminated before and after sampling each groundwater monitoring well. Loose dirt or debris was removed, as necessary, using a stiff bristle brush and clean cloth. Ancillary equipment, including the water level sounder, was rinsed (steam cleaned) with high pressure water. The portable sample pump was submerged in a mixture of potable water and laboratory-grade soap and powered on to circulate the soap and water mixture through the pump. Finally, the exterior of the pump was rinsed and the entire internal pump system was flushed with deionized water. Dedicated polyethylene tubing was used at each well. Wells were sampled in order based on previous analytical results, with sampling progressing from wells with non-detectable concentrations to wells with the highest concentrations.

## 5.2 Sample Preservation and Containers

Samples for BTEX, MTBE, and chlorinated VOC analysis were collected in new, clean, 40 milliliter (ml) volatile organic analysis (VOA) glass vials supplied by the analytical laboratory to Arcadis with 0.5 ml of hydrochloric acid (HCl). The purpose of the HCl is to retard or prevent any naturally occurring biodegradation of the analytes that may occur in the VOAs during sample transit. Samples for methane, ethane, and ethene were collected in new, clean, unpreserved, 40 ml VOA glass vials. Pace provided plastic bottles for the MNA analytes. Total iron was preserved with nitric acid; nitrate-nitrite was preserved with sulfuric acid; and the remaining MNA analytes were not preserved, in accordance with USEPA method protocols.

Following collection, samples were kept on ice until delivery to the laboratory. Samples were delivered to a Federal Express shipping store and shipped to the Pace laboratory via overnight delivery at the end of each day. All samples were analyzed within the allowable holding time criteria.

## 5.3 Sample Labeling, Shipment, and COC Protocols

Samples were labeled in the field with a unique name and/or number for identification and tracking of sample information. Quality control samples were also labeled with a unique location name and/or number. After collection and labeling, all water samples were placed in laboratory-supplied coolers and kept cooled and on ice until they were delivered to the laboratory representative.

COC records listing each sample and the custody of the sample at all times were used to track all samples from the time of sampling to the arrival of samples at the laboratory. The COC record included the project name, signature of samplers, sample name or number, analytical methods requested, signatures of individuals involved in sample transfer and signatures of individuals receiving the samples. COC records along with the complete laboratory analytical reports and are included in Appendix E.

## 5.4 Data Evaluation

All samples were analyzed for VOCs in accordance with USEPA Method 8260B; dissolved gases (methane, ethane, and ethene) by Method RSK-175; total iron in accordance with USEPA Method 6010B; and general chemistry including sulfate, nitrate, nitrite, and total dissolved solids, by a variety of methods as referenced in the laboratory report. The laboratory is required to follow standard USEPA protocols when analyzing samples for these approved methods. The protocols include quality control (QC) procedures such as the testing of matrix spikes and matrix spike duplicates (MS/MSD), laboratory control samples (LCS), and method blanks to demonstrate instrument and chemist capability.

Laboratory analytical reports included Tier II data deliverables, which include a summary report of the laboratory QC findings. Complete laboratory analytical reports are included in Appendix E. Data generated from the groundwater sampling activities was reviewed in accordance with the method specified criteria, USEPA National Functional Guidelines of October 1999 (USEPA 1999) and USEPA National Functional Guidelines for Organic Superfund Methods of November 2020 (USEPA 2020), as appropriate. The comprehensive data review report is included in Appendix F; a brief discussion follows.

### 5.4.1 Precision

Precision measures the reproducibility of repetitive measurements and is usually expressed in terms of imprecision. For this project, precision was evaluated by determining the relative percent difference (RPD) in results for the MS/MSD, LCS and laboratory control sample duplicate (LCSD), and field duplicate samples.

During the first quarter 2024 sampling event, MS/MSD RPD data are used to assess the precision of the analytical method. Laboratory standards for RPD were used for evaluating laboratory MS/MSD samples. The following compounds exhibited recoveries outside of the control limits:

- MW-4, MW-6 and WR-463A: vinyl acetate
- MW-18: dichlorodifluoromethane, vinyl acetate
- R-122A: dichlorodifluoromethane
- WR-430A: iodomethane, ethanol

The following sample locations exhibited an RPD greater than of the control limit:

- MW-22: ethanol

- MW-19: acetone, acrylonitirile, benzene, bromobenzene, sec-butylbenzene, tert-butylbenzene, carbon tetrachloride, carbon disulfide, chlorobenzene, chloroethane, chloroform, chloromethane, dichlorodifluoromethane, 1,1-dichloroethane, 1,1-dichloroethene, cis- 1,2-dichloroethene, trans- 1,2-dichloroethene, ethylbenzene, 2-hexanone, 2-butanone (MEK), iodomethane, 4-methyl-2-pentanone (MIBK), naphthalene, n-propylbenzene, 1,1,2-trichlorotrifluoroethane, tetrachloroethene, toluene, 1, 2, 4-trichlorobenzene, 1,1,1-trichloroethane, trichlorethene, trichlorofluoromethane, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, vinyl chloride, xylenes, total, ethanol, and tert-butyl alcohol
- WR-430A: ethanol

The MS/MSD analysis for dissolved gasses was performed on sample locations MW-13, MW-18, MW-30, MW-19, MW-6, WR-463A, R-122A, and WR-430A exhibited recoveries and RPD between recoveries within the control limits.

The MS/MSD analysis for metals was performed on sample locations MW-4, MW-30, MW-19, MW-6, WR-463A, R-122A, and WR-430A exhibited recoveries within control limits.

The MS/MSD or MS analysis performed for nitrate, nitrite, and sulfate on sample locations MW-13, MW-4, MW-30, and R-122A exhibited recoveries within the control limits. All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte:

- MW-19 and WR-430A: nitrate
- MW-6 and WR-463A: sulfate

The laboratory duplicate RPD criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the contract-required detection limit (CRDL). A control limit of 20 percent for water matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the CRDL, a control limit of one times the CRDL is applied for water matrices.

- For VOCs, the calculated RPD and results between the parent samples and their associated field duplicate were acceptable for all sample locations.
- For dissolved gases, the results and calculated RPDs between the parent samples and their associated field duplicate were acceptable.
- For metals, the results and calculated RPDs between the parent samples and their associated field duplicate were acceptable.
- For general chemistry, the calculated RPDs between the parent samples and their associated field duplicate were acceptable.

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 25 percent for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the reporting limit, a control limit of two times the reporting limit is applied for water matrices.

Five field duplicate samples were collected during the first quarter 2024 sampling event. The duplicate samples were collected, numbered, and handled in the same manner as the parent samples. The calculated RPDs between the parent samples and field duplicate samples for MW-2, MW-17, MW-28, WR-464A, and R-067A were

acceptable. Duplicate analytical results are listed below the original groundwater analytical results in Tables 2 and 4.

During the second quarter 2024 sampling event, MS/MSD RPD data are used to assess the precision of the analytical method. Laboratory standards for RPD were used for evaluating laboratory MS/MSD samples. The following compounds exhibited recoveries outside of the control limits:

- MW-2: tert-butylbenzene, 1,2,4-trimethylbenzene
- MW-28: dichlorodifluoromethane
- WR-464A: iodomethane
- WR-359A: tert-butyl alcohol

The following sample locations exhibited an RPD greater than of the control limit:

- MW-13 and MW-28: ethanol
- MW-22: benzene, sec-butylbenzene, tert-butylbenzene, carbon tetrachloride, carbon disulfide, chlorobenzene, chloroethane, chloromethane, dichlorodifluoromethane, 1,1-dichloroethane, 1,1-dichloroethene, ethylbenzene

The MS/MSD analysis performed for dissolved gasses on sample locations MW-13, MW-5, MW-18, MW-20, MW-27, WR-463A and WR-430A exhibited recoveries and RPD between recoveries within the control limits. A laboratory duplicate analysis was performed on sample locations MW-1, MW-16-DUP, MW-32S and WR-464A. The RPD was within control limits.

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75 percent to 125 percent. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. The MS/MSD analysis performed on sample locations MW-13, MW-5, MW-18, MW-20, MW-27, WR-463A and WR-430A exhibited recoveries within the control limits.

The MS analysis performed for nitrate, nitrite, and sulfate on sample location MW-2, and MS/MSD analysis performed for nitrate nitrite on sample location WR-430A, exhibited recoveries and RPD between the recoveries within the control limits. The sulfate MS/MSD analysis for sample location MW-20 was analyzed undiluted. The MS/MSD recoveries were not evaluated due to sulfate results that were over the calibration range.

Sample locations associated with the MS/MSD exhibiting recoveries outside of the control limits were:

- MW-13, MW-5, MS-18, MW-27, WR-463A and WR-430A: sulfate

The laboratory duplicate RPD criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the CRDL. A control limit of 20 percent for water matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the CRDL, a control limit of one times the CRDL is applied for water matrices.

- For VOCs, the calculated RPD and results between the parent samples and their associated field duplicate were acceptable for all sample locations.
- For dissolved gases, the results and calculated RPDs between the parent samples and their associated field duplicate were acceptable.
- For metals, the results and calculated RPDs between the parent samples and their associated field duplicate were acceptable.

- For general chemistry, the calculated RPD between the parent samples and their associated field duplicate were acceptable for parent samples MW-1 and MW-16. The analyte nitrate associated with sample locations WR-464A and WR-464A-DUP exhibited a field duplicate RPD greater than the control limit. The associated sample results from sample locations for nitrate were qualified as estimated.

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 25 percent for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the reporting limit, a control limit of two times the reporting limit is applied for water matrices.

Four field duplicate samples were collected during the second quarter 2024 sampling event. The duplicate samples were collected, numbered, and handled in the same manner as the parent samples. The calculated RPDs between the parent samples and field duplicate samples for MW-19, MW-27, MW-18 and WR-359A were acceptable. Duplicate analytical results are listed below the original groundwater analytical results in Tables 2 and 4.

### 5.4.2 Accuracy

Accuracy is the agreement between a measured concentration and a known concentration. LCS and MS samples were used to evaluate the accuracy of the analytical results generated from this project. Pace's laboratory acceptance criteria were used for evaluating accuracy.

The LCS and LCSD recoveries were within the laboratory-established acceptance limits for all metals, dissolved gases, and inorganics.

During the first quarter 2024 sampling event, or VOCs, the following sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits were qualified as accordingly:

- MW-4, MW-13, MW-14, MW-1, MW-5, EB-1, Trip Blank, MW-2, MW-2-DUP, MW-25, MW-18, MW-24, Trip Blank – vinyl acetate.
- MW-30, MW-22, MW-21, MW-20, Trip Blank – n-butylbenzene.
- MW-6, MW-28, MW-28-DUP, MW-32S, MW-29S, Trip Blank, WR-463A, R-079A, Trip Blank – vinyl acetate, naphthalene.
- R-122A, WR-242A, WR-464A-DUP, WR-464A, WR-467A, R-082A, EB-3, Trip Blank – 1,1,2-trichloroethane, bromochloromethane.
- WR-430A, R-067A, R-067A-DUP, WR-359A, Trip Blank – Iodomethane, Ethanol.

For VOCS, the following sample locations associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit:

- MW-2, MW-18 – 2-butanone (MEK), bromomethane.
- MW-19, MW-17, MW-17-DUP, MW-16, MW-27, MW-26, EB-2, Trip Blank – acrylonitrile, 1,2-dibromo-3-chloropropane, 2-hexanone.
- MW-6, MW-28, MW-28-DUP, MW-32S, MW-29S, Trip Blank – chloroethane.

- R-122A, WR-242A, WR-464A-DUP, WR-464A, WR-467A, R-082A, EB-3, Trip Blank – Iodomethane, bromomethane, trans-1,4-dichloro-2-butene.
- WR-430A, R-067A, R-067A-DUP, WR-359A, Trip Blank – carbon disulfide, chloromethane, trans-1,4-dichloro-2-butene, dichlorodifuoromethane, trans-1,2-dichloroethene, 2-butanone (MEK), trichloroethene, trichlorofluoromethane, vinyl acetate, vinyl chloride.

During the second quarter 2024 sampling event, for VOCs, the following sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits were qualified as accordingly:

- MW-2, MW-20, MW-19, MW-19-DUP, MW-17, MW-6, EB-1 – acetone, trans-1,4-dichloro-2-butene.
- Trip Blank – acetone, chloroethane, trans-1,4-dichloro-2-butene, 1,1-dichloroethene, Iodomethane.
- MW-22, MW-27, MW-27-DUP, MW-16, MW-29S, EB-2, Trip blank – tert-butyl alcohol.
- MW-32S – cis-1,3-dichloropropene.
- MW-28, MW-18, MW-18-DUP, MW-24, MW-30, MW-26, EB-3, Trip Blank – carbon tetrachloride, 1,1,1-trichloroethane.
- R-082A – iodomethane.

For VOCS, the following sample locations associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit:

- MW-13, MW-14, MW-25, MW-4, Trip Blank, MW-5, MW-1, trip blank – vinyl acetate, ethanol.
- Trip Blank – trans-1,4-dichloro-2-butene, iodomethane.
- MW-22, MW-27, MW-27-DUP, MW-16, MW-29S, EB-2, Trip Blank – tert-butyl alcohol.
- MW-28, MW-18, MW-18-DUP, MW-24, MW-30, MW-26, EB-3, Trip Blank – chloromethane, trans-1,4-dichloro-2-butene, iodomethane.
- MW-21, Trip Blank 1, WR-463A, R-122A, R-079A, R-082A, Trip Blank 2 – acetone, dichlorofluoromethane, 2-hexanone, 2-butanone (MEK), vinyl acetate, ethanol.
- WR-093A, WR-359A, WR-359A-DUP, EB-4, Trip Blank – acrylonitrile, ethanol.

### 5.4.3 Representativeness

Representativeness expresses the degree to which the sample data accurately and precisely represent the media being sampled at a specific location at a specific time. Representativeness was achieved through use of the standard field and analytical procedures described in the Quality Assurance Project Plan (QAPP; LFR 2003).

### 5.4.4 Comparability

Comparability is the confidence with which one data set can be compared to other data. The objectives for this program were to produce data with the greatest degree of comparability possible. Comparability was achieved by following procedures outlined in the QAPP, including using standard methods for sampling and analysis, reporting data in standard units, and using standard and comprehensive reporting formats.

### 5.4.5 Completeness

Measurements of completeness can be defined as the ratio of usable measurements obtained to the total number of planned measurements for an activity. Usable measurements were those not rejected by the laboratory data validation. The requirement for completeness was 90 percent of the samples collected. One hundred percent of the laboratory results were accepted for use.

## 5.5 Summary of Data Quality

During the first quarter 2024 sampling event, sample locations R-067A and R-067A-DUP were analyzed at a 13.7-fold dilution and a 14.6-fold dilution, respectively. The lab only reported the diluted result.

During the second quarter 2024 sampling event, overall system performance was acceptable. Other than for those deviations specifically mentioned in the review, the overall data quality is within the guidelines specified in the method.

## 5.6 Field Quality Control Samples

### 5.6.1 Equipment Blank Samples

Arcadis collected three equipment blank samples during the first quarter 2024 sampling event. Two equipment blank samples were collected during the sampling event (EB-1 and EB-2), and one during the last day of sampling the wells (EB-3). Arcadis collected four equipment blank samples during the second quarter 2024 sampling event. Three equipment blank samples were collected during the sampling event (EB-1, EB-2, EB-3), and one during the last day of sampling the wells (EB-4). Equipment blanks were collected after following decontamination procedures (see Section 5.1) by pouring water through the sampling tee or over the sample pump, then collecting the water in laboratory-supplied VOA vials. The equipment blank samples were collected, numbered, and handled in the same manner as the other samples. The samples were analyzed for VOCs in accordance with USEPA Method 8260B. No VOCs were detected in any of the equipment blank samples, except for TBA in EB-1 (21.3 µg/L) and EB-2 (13.6 µg/L) in the first quarter 2024 and EB-2 (216 µg/L) in the second quarter 2024.

### 5.6.2 Trip Blanks

Pace provided Arcadis with a trip blank for each cooler. The trip blank was prepared by Pace by pouring laboratory-grade distilled/deionized water into a clean, unused sample container. The trip blank accompanied other sample containers during field activities and back to the laboratory. No VOCs were detected in the trip blanks analyzed, except for Trip Blank dated 5/16/2024 (10.5 µg/L).

# 6 Conclusions

Groundwater monitoring activities during the first and second quarter of 2024 included monthly measurements of depth-to-water and depth-to-product, and quarterly collection and analysis of groundwater samples. The following conclusions are based on evaluation of the above data:

- No free product was measured during the first or second quarter of 2024.
- In general, groundwater elevations increased from January 2024 to June 2024 Groundwater flow patterns continue to be similar to those observed since completion of the groundwater monitoring network. Contours across and to the west side of Silvercroft Wash indicate that recharge through the wash results in a groundwater flow divide.
- For the first quarter 2024 sampling event the following was observed:
  - Analytical results for the sampled SFPP wells were either non-detect or below AWQS for BTEX. BTEX was either non-detect below the laboratory reporting limit or below AWQS in the SFPP sampled COT wells. Reporting limits for samples MW-26, MW-29S, and MW-32S were elevated due to dilution for analyses. The plume of dissolved-phase BTEX above AWQS remains delineated to the south, west, east, and north
  - MTBE was detected above the 20 µg/L level in SFPP wells MW-29S (19,100 µg/L), and MW-32S (4,900 µg/L). MTBE was detected above the 20 µg/L level in COT wells R-067A (85.5 µg/L), WR-359A (313 µg/L), WR-430A (857 µg/L), and WR-464A (27.3 µg/L). The plume of dissolved-phase MTBE remains delineated to the south, west, east, and north.
  - TBA was detected above laboratory reporting limits in SFPP wells MW-02 (22.7 µg/L), MW-04 (41.3 µg/L), MW-05 (5.19 µg/L), MW-13 (6.82 µg/L), MW-19 (7.4 µg/L), MW-21 (22.9 µg/L), and MW-26 (805 µg/L). TBA was detected above laboratory reporting limits in COT wells R-067A (14,600 µg/L), R-122A (5.74 µg/L), WR-359A (26,800 µg/L), WR-430A (1,880 µg/L), and WR-464A (142 µg/L). There is no AWQS established for TBA.
  - PCE concentrations above laboratory reporting limits in SFPP wells MW-27 (2.13 µg/L) and MW-28 (16.6 µg/L). The AWQS for PCE is 5 µg/L. TCE concentrations were detected in well MW-28 (2.16 µg/L), however, this concentration did not exceed the AWQS of 5 µg/L for TCE. The PCE and TCE are likely from one or more landfills in the vicinity. The SFPP pipelines carry fuels only; therefore, the pipeline release could not have been a source of PCE or TCE.
- For the second quarter 2024 sampling event, the following was observed:
  - Analytical results for the sampled SFPP wells were either non-detect or below AWQS for BTEX. BTEX was either non-detect below the laboratory reporting limit or below AWQS in the SFPP sampled COT wells. Reporting limits for samples MW-29S, MW-32S, R-067A, and WR-430A were elevated due to dilution for analyses. The plume of dissolved-phase BTEX above AWQS remains delineated to the south, west, east, and north.
  - MTBE was detected above the 20 µg/L level in SFPP wells MW-29S (16,200 µg/L), and MW-32S (103 µg/L). MTBE was detected above the 20 µg/L level in COT wells R-067A (124 µg/L), WR-359A (185 µg/L), WR-430A (416 µg/L), and WR-464A (27.8 µg/L). The plume of dissolved-phase MTBE remains delineated to the south, west, east, and north.
  - TBA was detected above laboratory reporting limits in SFPP wells MW-04 (32.0 µg/L), MW-22 (8.04 µg/L), MW-26 (388 µg/L), and MW-27 (6.30 µg/L). TBA was detected above laboratory reporting limits in COT wells R-067A (11,300 µg/L), WR-359A (19,300 µg/L), WR-430A (2,750 µg/L), and WR-464A (191 µg/L). There is no AWQS established for TBA.

  - PCE concentrations above laboratory reporting limits in SFPP wells MW-27 (1.96 µg/L) and MW-28 (13.7 µg/L). The AWQS for PCE is 5 µg/L. TCE concentrations were detected in well MW-28 (1.74 µg/L), however, this concentration did not exceed the AWQS of 5 µg/L for TCE. The PCE and TCE are likely from one or more landfills in the vicinity. The SFPP pipelines carry fuels only; therefore, the pipeline release could not have been a source of PCE or TCE.

- The intermediate (MW-29M, MW-31M, MW-32M) and deep (MW-29D, MW-31D, MW-32D) wells were not sampled during the first and second quarter of 2024 due to on-going air sparging.
- Measurements of MNA parameters in groundwater suggest that variations are due to natural attenuation of hydrocarbons in some wells and to landfill water quality impacts in the northeast portion of the study area.
- Groundwater samples collected during the first and second quarters indicate that air sparging continues to be effective in increasing dissolved oxygen levels and enhancing aerobic biodegradation of MTBE mass.

# 7 Upcoming Work

Groundwater Sampling

Depth-to-water and depth-to-product measurements will be collected monthly. The next quarterly sampling event was conducted in August 2024.

Soil Vapor Extraction

Completion of the soil vapor extraction and treatment system operation has been approved by ADEQ. ADEQ granted a No Further Action Determination for Soil; Non-Source Area Soils SFPP Silvercroft Wash Release Site, Tucson, Arizona, Site Code: 506251-00 on October 9, 2018 and a No Further Action Determination for Soil for Source Area Soils, SFPP Silvercroft Wash Release Site, Tucson, Arizona, Site Code: 506251-00 on November 12, 2019.

Reporting

Arcadis submitted the final RAP to ADEQ on May 5, 2023. ADEQ approved the RAP in a letter dated May 16, 2023. As discussed in the RAP, semiannual reports will be submitted summarizing field activities, analytical results, and sparge system performance. The next semiannual report will be submitted in the first quarter of 2025.

Air Sparge Performance Evaluation

The air sparge system is operating and injecting air into MW-29M, MW-29D, MW-31M, MW-31D, MW-32M, and MW-32D. Semiannual reports will be submitted to ADEQ summarizing field activities, analytical results, and sparge system performance. An annual evaluation of data will be performed using a Mann-Kendall analysis described in the RAP and will be included in the second semiannual report to be submitted in the first quarter of 2025.

# 8 Limitations Statement

The opinions and recommendations presented in this report are based upon the scope of services, information obtained through the performance of the services, and the schedule as agreed upon by Arcadis and the party for whom this report was originally prepared. This report is an instrument of professional service and was prepared in accordance with the generally accepted standards and level of skill and care under similar conditions and

circumstances established by the environmental consulting industry. No representation, warranty or guarantee, express or implied, is intended or given. To the extent that Arcadis relied upon any information prepared by other parties not under contract to Arcadis, Arcadis makes no representation as to the accuracy or completeness of such information. This report is expressly for the sole and exclusive use of the party for whom this report was originally prepared for a particular purpose. Only the party for whom this report was originally prepared and/or other specifically named parties have the right to make use of and rely upon this report. Reuse of this report or any portion thereof for other than its intended purpose, or if modified, or if used by third parties, shall be at the user's sole risk.

Results of any investigations or testing and any findings presented in this report apply solely to conditions existing at the time when Arcadis' investigative work was performed. It must be recognized that any such investigative or testing activities are inherently limited and do not represent a conclusive or complete characterization. Conditions in other parts of the project site may vary from those at the locations where data were collected. Arcadis' ability to interpret investigation results is related to the availability of the data and the extent of the investigation activities. As such, 100 percent confidence in environmental investigation conclusions cannot reasonably be achieved.

Arcadis, therefore, does not provide any guarantees, certifications or warranties regarding any conclusions regarding environmental contamination of any such property. Furthermore, nothing contained in this document shall relieve any other party of its responsibility to abide by contract documents and applicable laws, codes, regulations or standards.

**NOTES**
· Results displayed in **bold** exceed the Arizona Aquifer Water Quality Standard (AWQS).
· MTBE = Methyl tert-butyl ether.
· PCE = Tetrachloroethene.
· TCE = Trichloroethene.
· C12DCE = cis-1,2-dichloroethene.
· $CCl_2F_2$ = Dichlorodifluoromethane.
· TBA = Tert-butyl alcohol.
· < = Analyte concentration below displayed detection limit.
· N/A = AWQS not applicable; no standard exists.

**NOTES**
· DO = Dissolved oxygen.
· ORP = Oxidation reduction potential.
· * = Due to the Hach SU-5 sulfite test kit's titration analysis method, sulfite concentrations are accurate to within 0.64-mg/L intervals.
· NR = Not recorded.
· mg/L = milligrams per liter.
· mV = millivolts.

- Approximate extent of dissolved-phase MTBE above 20 µg/L
- Groundwater elevation contour (with direction of groundwater flow)

## Notes

- Aerial photo source: ESRI World Imagery.
- Depths to groundwater were measured on 2/28/2024.
- Wells were sampled from 2/29 to 3/13/2024.
- Groundwater elevations are expressed in feet above mean sea level (ft amsl).
- Concentrations are expressed in micrograms per liter (µg/L).
- No wells contained light non-aqueous phase liquid (LNAPL) during the February–March 2024 monitoring event.
- GWL = Groundwater elevation.
- BENZ = Benzene.
- TOL = Toluene.
- ETHYL = Ethylbenzene.
- XYL = Total xylenes.
- MTBE = Methyl tert-butyl ether.
- TBA = Tert-butyl alcohol.
- PCE = Tetrachloroethene.
- TCE = Trichloroethene.
- # = Well is screened at a greater depth than others and is not used in contouring.
- < = Analyte not detected above the indicated laboratory detection limit.
- NM = Not measured.
- NS = Not sampled.

## ADEQ Approval Email

## Forsberg, Bob

**From:** Joey Pace <Pace.Joey@azdeq.gov>
**Sent:** Friday, September 26, 2014 7:37 AM
**To:** Forsberg, Bob
**Cc:** Julie Hoskin; Paul_Salcido@kindermorgan.com; Nesky, Michael
**Subject:** RE: Silvercroft Sampling Reduction Request

**Importance:** High

Bob:
The VRP **approves** of your request to remove **MW-3, MW-7, MW-8, MW-9, MW-10, MW-11, MW-12, MW-15, and MW-23** from the upgradient monitoring schedule. However, please note that the VRP will request that *MW-10* be returned to the monitoring schedule immediately, if at any time the concentrations in MW-05 rise above the AWQS (including the MDLs in non-detect samples from this well).

The VRP also **approves** of your request to **discontinue the three volume purge comparison sampling of MW-27, MW-28, MW-29S, MW-29M, MW-29D, and MW-30** as of the fourth quarter 2014 sampling event.

Please accept this electronic correspondence as formal approval of the above-referenced items. No hard copy letter will follow. You may begin incorporating these changes as of the fourth quarter 2014 event, scheduled for October 1, 2014.

**Subject:** Silvercroft Sampling Reduction Request

Hi Joey-

It was great to see you again yesterday. Per our discussion at the meeting on September 24, 2014, KMEP is requesting to reduce the number of wells monitored during the quarterly sampling event. The monitor wells we are requesting to be removed from the quarterly sampling events are the following: MW-3, MW-7, MW-8, MW-9, MW-10, MW-11, MW-12, MW-15, and MW-23. I have attached a figure showing the locations of these wells and historical data. These monitor wells are located upgradient of the source area and have been non-detect below laboratory reporting limits or below Arizona aquifer water quality standards for several consecutive years now. Monitor wells MW-1, MW-20, MW-4, MW-5, and MW-13 will continue to be sampled to provide data regarding the upgradient conditions.

In addition, as agreed to in the meeting, KMEP will discontinue the three volume purge comparison sampling of MW-27, MW-28, MW-29S, MW-29M, MW-29D, and MW-30 during the fourth quarter 2014 sampling event. ADEQ approved the

switch to low flow purge at a meeting on September 23, 2013 but requested that the new wells be sampled using both techniques to compare the methodologies. The new monitor wells have been sampled using both low flow purge technique and three volume purge technique for three consecutive quarters beginning in the first quarter 2014. I have attached is the data associated with the sampling comparisons. The comparison generally demonstrates that there are no major differences in concentrations between the two purge methods. Differences in the concentrations between the two sampling techniques is likely the result of various factors including anisotropy in the subsurface, fate and transport of dissolved-phase hydrocarbon mass, lingering effects of well development activities (e.g., development of MW-30 produced over 4,300 gallons of water, and concluded with a pumping rate of more than 40 gpm for approximately 30 minutes), and attenuation.

As discussed in the meeting, we will be starting our fourth quarter 2014 sampling event on October 1 and would like to incorporate these changes into this event. Please let me know if you need additional information or would like to discuss the data further.

Thanks,
Bob

Mr. Paul Salcido, Project Manager, Remediation
Kinder Morgan Energy Partners, L.P.
7776 Pointe Parkway West, #185
Phoenix, AZ 85044

**RE:** **Approval of *Fourth Quarter 2016 Groundwater Monitoring Report***
SFPP Silvercroft Wash Release Site
Tucson, Arizona
Site Code: 506251-00

Dear Mr. Salcido:

The Arizona Department of Environmental Quality Voluntary Remediation Program (VRP) has completed its review of the *Fourth Quarter 2016 Groundwater Monitoring Report* (GMR) dated February 2017 and prepared by ARCADIS on behalf of Kinder Morgan Energy Partners, L.P. (KMEP) for the Santa Fe Pacific Pipeline Partners Silvercroft Wash Release VRP site located in Tucson, Arizona.

The GMR is hereby approved. The VRP has been informed that KMEP has added additional City of Tucson wells to the sampling plan for the site to address the downgradient delineation of methyl tertiary butyl ether. Please be sure to include information regarding the addition of these wells to the sampling plan in the First Quarter 2017 GMR.

If you have any questions, please contact me by electronic mail at jp8@azdeq.gov or at (602) 771-4818.

Regards,

Joey Pace, Project Manager
Voluntary Remediation Program

## Well Dry

In order to view and enter sampling information below, you must measure DTW upon return and enter it in the field above.

## Sample Information

| | |
|---|---|
| Type of Equipment Used - Sample | Submersible Pump |

This sample record is still in draft. Please tap into the sample record and fill out all required fields so that other team members will be able to see it. Then save and sync. If the linked record displays "The requested record is not on the device", the linked record is only saved locally on the device where it was first created.

Warning: This record has been duplicated. If a sample is still linked, you must delete the old sample record and select or create a new one. Contact fieldnow@arcadis.com with questions.

Entering Sample Information The fields you see in the "Sample Summary Information" section are read-only fields. Click on the button (sample record) above to populate these details.

Well is considered stabilized and ready for sample collection when the following is met for three consecutive readings collected at 3 to 5 minute intervals: -turbidity remains within 10% (or if three consecutive values are <5NTU) -specific conductance and temp remain within 3% -ORP within + or - 10 mV -DO within 10% (or if three consecutive values are <0.5 mg/L) -pH within 0.1 unit

**NOTES**

· For potentiometric surface calculations, specific gravity = 0.75.
· NP = No light non-aqueous phase liquid (LNAPL) detected.
· * = Top of casing elevation is unknown.
