1 INTRODUCTION

This document is an addendum to the *Final, Remedial Investigation (RI) Report, Former 15 Skeet Ranges, Kingman Ground-to-Ground Gunnery Range, Kingman, Mohave County, Arizona,* dated June 2021. The Final RI documented the field work performed between January 15, 2019 to October 31, 2019 and results of skeet fragments and lead shot pellets observations and incremental sampling method (ISM) soil sampling for 60 Assessor's Parcel Number (APN; parcels), located within the Former 15 Skeet Ranges, Kingman ground-to ground (GTG) Gunnery Range in Kingman, Mohave County, Arizona (Site). Field work, including geophysical surveying, reconnaissance and visual observation of residual War II clay pigeons (skeet) fragments/debris and lead shot pellets, and ISM (ITRC, 2012, 2020) soil sampling at each parcel, was completed to characterize the environmental conditions and soil media, and to determine the nature and extent of potentially hazardous substances [metals (antimony, copper, lead and zinc) and polycyclic aromatic hydrocarbons (PAHs)]. The sampling results from the 60 parcels investigated during the 2019 RI, as well as the 55 parcels selected for Time Critical Removal Action (TCRA) implemented by Eco and Associates, Inc. (ECO) in April and May 2013 and Ahtna Engineering Services (Ahtna) from October 2013 to July 2014, and the 66 RI parcels investigated between December 2014 and February 2017 by ECO, were used as inputs for exposure area determinations, and evaluated in the Human Health Risk Assessment (HHRA) included with the Final RI (NOREAS, 2021).

This RI Addendum Report (Report) prepared by NOREAS, Inc. (NOREAS) is to document the additional investigation activities conducted at 30 additional parcels and one easement area, between January 2020 and April 2021 within the Former 15 Skeet Ranges area. The sampling results were used to characterize the environmental conditions and soil media at the RI Addendum investigated parcels and easement areas, and to incorporate the RI Addendum results with an updated HHRA (NOREAS, 2021), to estimate the potential health impacts associated with the contaminants detected in soil.

This Report has been prepared on behalf of the United States Army Corps of Engineers (USACE), Los Angeles District, under the Contract No. W912PL-17-C-0006. Under the contract, NOREAS is to provide environmental support for the continuation and completion of a RI, including risk

assessment at the Former Skeet Range Munitions Response Site 03 (MRS03[1] Site or the Site) (Figure 1-1). The work conducted during the RI Addendum followed the general procedures outlined in the approved project *Final Remedial Investigation (RI) and Feasibility Study (FS) Work Plan* (Work Plan), (ECO, 2014), as amended by the Final Quality Assurance Project Plan (QAPP) Addendum No. 1 (NOREAS, 2018), approved by USACE and Arizona Department of Environmental Quality (ADEQ) in September 2018.

The contract work falls under the Defense Environmental Restoration Program (DERP) and MRS03 Site, a Formerly Used Defense Site (FUDS) project No. J09AZ0412-01. The project work is conducted under the provisions of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). All activities during the phases of field work were conducted in compliance with USACE requirements.

This RI Addendum Report documents the results of 30 parcels and one easement, including seven resampled[2] and three further sub-divided parcels[3] reported in the RI.

In this RI Addendum to the Final RI (NOREAS, 2021), relevant figures and tables have been updated to include the 30 RI Addendum parcels and one easement and their respective investigated results. The HHRA for RI Addendum parcels and easement is included as Appendix A. This Report supplements the Final RI (NOREAS, 2021) to document the additional investigative RI Addendum activities and results, toward the overall assessment of current conditions at the Former 15 Skeet Ranges GTG Gunnery Range.

This RI Addendum Report also includes the following appendices:

[1] The Site was originally designated as part of MRS 03. Subsequent to the Site Inspection (SI) (Parsons Infrastructure and Technology Group, Inc. [Parsons], 2011), the Site was redesignated in USACE records as a small portion of MRS01. However, due to legacy and report consistency considerations, sampling records and reports continued to refer to the Site under the MRS03 name.

[2] Seven parcels (APN 324-04-558, APN 324-04-668, APN 324-05-265, APN 324-05-267, APN 324-37-017, APN 324-39-020, and APN 324-05-263A) with rejected data from 2019 RI sampling activities, were resampled during the RI Addendum.

[3] Due to their areal extent, parcels APN 310-21-063(A-K), 310-21-078(A-N), 310-38-002(A-Q), 310-40-005(A-O) and Thompson easement(A-Q), were sub-divided into sub-parcels for sampling.

- **Appendix A** Updated Human Health Risk Assessments (HHRAs) – includes HHRA results for RI Addendum parcels and easement, including individual parcels, sub-parcels and subdivision of easement.
- **Appendix B** Data Quality Summary Report– describes the quality and usability of analytical data collected for the RI Addendum activities.

Attachment 1 to this Report includes individual RI Addendum parcel reports along with the field logs, Global Positioning System (GPS) survey results, photographs, laboratory analytical reports, and data validation reports.

2 REMEDIAL INVESTIGATION APPROACH

This section presents a summary of the remedial investigation approach for the RI Addendum.

2.1 FIELD INVESTIGATION APPROACH

Field work was performed in accordance with the Work Plan (ECO, 2014) and Final QAPP Addendum No. 1 (NOREAS, 2018). RI Addendum activities focused on:

1. Continuing the completion of remedial investigation of properties/parcels started by ECO in 2013 (ECO, 2017) and NOREAS (NOREAS, 2021)
2. Including properties/parcels that extended beyond the initial 284 parcels (based on the 2017 site reconnaissance surveillance);
3. Performing field activities at properties/parcels for which right of entries (ROEs) were granted; and
4. Incorporating adjoining parcels that were located next to parcels impacted by PAHs and/or metals above respective screening levels (NOREAS, 2018). In these instances, bordering parcels were added to the list of parcels proposed for sampling, and a ROE for sampling was pursued.

Based on these criteria, RI Addendum field investigation activities were completed at 30 parcels and Thompson easement [Thomp (A through Q)], including four sub-parcels [APN31021063(A through K), APN31021078(A through N), APN31038002 (A through Q), APN31040005 (A through O)] between January 21, 2020, and April 8, 2021. Table 2-1 tabulates the list of parcels evaluated and depicted in Figure 2-1.

As discussed in the Final QAPP Addendum No. 1 (NOREAS, 2018), the sampling approach was designed to evaluate chemicals of potential concern (COPCs) on a parcel-by-parcel basis. Each parcel sampled was identified by a unique APN, with considered decision units (DUs): DU-1 [surface (0 to 2 inches)], DU-2 [subsurface (0 to 1-foot)], and DU-3 [subsurface (1-foot to 2 feet)].

The field investigative method was based on visual observation of skeet fragments and laboratory soil analytics for inorganic constituents (metals) and organic constituents (PAHs).

The soil sampling focused on assessing the potential presence of COPCs based on past uses/activities for the Site, results of previous investigations, and observations made in the field. Soil samples were collected, combined, processed, and subsampled according to ISM using Interstate Technology & Regulatory Council (ITRC) guidelines (ITRC, 2020). Typically, soil samples were collected from three distinct depth intervals [e.g., surface (0 to 2 inches) and subsurface (0 to 1-foot below ground surface (bgs) and 1-foot to 2 feet bgs)], in triplicate at all parcel and/or sub-parcel locations. Soil samples were collected from additional depth intervals (i.e., 2 feet to 3 feet bgs, 3 feet to 4 feet bgs, 4 feet to 5 feet bgs, and 5 feet to 6 feet bgs) at parcels where there were indications of deeper impacts.

As discussed in the QAPP Addendum No. 1, the extent of COPCs was assessed with the updated screening values to determine if the vertical extent of contamination was defined by the RI Addendum sampling. As stated in the Draft Final RI, the updated screening values were based on the modification of Arizona Soil Remediation Levels (SRLs) to reflect changes in the toxicity values for PAHs by United States Environmental Protection Agency (USEPA, 2020).

2.2 LABORATORY ANALYTICAL PROGRAM

All soil samples collected during the RI Addendum were submitted for analysis to Eurofins Environment TestAmerica Laboratories, Inc. (Eurofins TestAmerica) in Arvada, Colorado (Eurofins TestAmerica-Denver). Eurofins TestAmerica-Denver holds current Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP) accreditation for the analytical methods used. Samples were submitted for ISM processing and analysis of PAHs by United States Environmental Protection Agency (USEPA) Method 8270C Selected Ion Mode (SIM), and for the metals, including antimony, copper, lead, and zinc by USEPA Method 6010B. COPCs were reported in milligrams per kilogram (mg/kg) for metals and micrograms per kilogram (µg/kg) for 16 PAHs (i.e., 2-methylnaphthalene, acenaphthene, anthracene, benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene, pyrene).

Following the Final QAPP Addendum No. 1 (NOREAS, 2018), the analytical data was provided by the laboratory in hard copy and electronic report formats containing raw instrument and method

quality control (QC) data to allow staged validation levels. Copies of the laboratory analytical reports are provided in Attachment 1 as a part of the parcel reports.

All of the analytical data generated during the RI Addendum were subject to third-party, independent validation by Synectics in Sacramento, California. Data validation process and results are detailed in Appendix B. Copies of the validation reports are included in Attachment 1 as a part of the RI Addendum parcel reports. The analytical laboratory and third-party validation reports were reviewed for QC issues identified during the analytical process and data usability.

2.2.1 Data Analysis Methodology

Calculation of 95% upper confidence limit (UCL) concentrations of soil sample results was performed for each parcel using the USEPA ProUCL 5.1.002 software (USEPA, 2015). The 95% UCL for all ISM samples was determined using the Chebyshev method, which is recommended for use in ISM-based samples, as this method provides a conservative estimate of the UCL (ITRC, 2020). The Chebyshev method is based on non-parametric (no distributional) assumptions of the data set.

For risk screening purposes, sample results using the 95% UCL concentrations are used as inputs for exposure area determinations in risk assessment. The ProUCL statistical summary and the 95% UCL values are provided in Section 4. In cases where an analyte was not detected in a soil sample, a result equal to one-half of the analyte reporting limit was assumed for 95% UCL determinations.

Data validation was performed in accordance with DoD Quality Systems Manual (QSM) version 5.1, DoD General Data Validation Guidelines (DoD, 2017), DoD Data Validation Guidelines Module 1 (DoD, 2020a), and blank data evaluation for metals analysis based on the DoD Module 2: Data Validation Procedure for Metals by ICP-OES (SW-846 6010) (DoD, 2020b), Final QAPP Addendum No. 1 (NOREAS, 2018), Field Change Form Request (FCRF)-001 (NOREAS, 2019a), and FCRF-002 (NOREAS, 2019b). The overall data quality was determined based on the analytical results generated for field and laboratory quality assurance/quality control (QA/QC) samples during this project. QA/QC for field activities was ensured through standardized sampling methods, rigorous documentation, and the collection of field QC samples as described in the Final QAPP Addendum No. 1 (NOREAS, 2018). All laboratory analytical data were reviewed and

validated by Synectics in Sacramento, California. A complete summary of the QC review is provided in Appendix B (Data Quality Summary Report).

3 SUMMARY OF RI ADDENDUM FIELD ACTIVITIES

Between January 21, 2020 and April 8, 2021, 30 parcels and one easement area, including the four subdivided parcels and easement, were investigated as part of the RI Addendum. The following subsections provide a summary of the field activities completed as part of the RI Addendum. GPS Survey data by parcel is provided in Attachment 1 as a part of the RI Addendum parcel reports. Field activities were noted in a field logbook and documented on each parcel field log provided in the respective parcel reports in Attachment 1. Pre-field, during the field, and post-field activity photographs were taken at each parcel and provided in Attachment 1 as a part of the parcel reports.

3.1 RIGHT OF ENTRY AND UTILITY CLEARANCE

Prior to any subsurface field activities, USACE secured ROEs granting access to the APNs/properties to perform RI Addendum activities. ROEs were signed by property owners or representatives and provided to NOREAS by USACE.

Additionally, before performing soil sampling activities, utility clearances were conducted. At least 48 hours prior to field work, Arizona 811 was notified of planned activities, and dig permits were obtained. Geophysical evaluations were also performed by Safe Site Utility Services, LLC, to identify other potential subsurface utilities at each of the parcels.

3.2 SITE DEMARCATION AND VISUAL SCREENING FOR SKEET AND LEAD SHOT

Between January 21, 2020 and April 8, 2021, as a part of the RI Addendum field investigation, parcels were delineated using high-visibility sampling whiskers to identify the corners of each parcel's sampling grid. Once parcels/sub-parcels[4]/DUs were delineated and staked, the DUs were then subdivided into 10 approximately equally sized grid sampling units (SUs). After demarcation was complete, observations for clay pigeon fragment evidence at each parcel and within each SU at the ground surface and then again during subsurface field activities were recorded in a field logbook, and on each parcel field log. The clay pigeon fragment locations were GPS surveyed and photographed, if observed.

[4] Due to their areal extent, parcels APN 310-21-063(A-K), APN 310-21-078(A-N), APN 310-38-002(A-Q), APN 310-40-005(A-O) and Thompson easement(A-Q), were divided into sub-parcels for sampling.

Clay pigeons were discerned from other debris by their distinct black color, circular-like patterns or raised printed text, and their ability to leave a distinct black "streak" when rubbed against a hard, rough surface. Skeet fragment and/or lead shot pellet detection, their location within each parcel by SUs, size of skeet fragment, GPS survey point, and photographs are detailed in the respective parcel reports included as Attachment 1. Visual observations of skeet fragments observed on the surface and/or subsurface are discussed in Section 4.1.1.

3.3 ISM SOIL SAMPLING

Sample collection followed the same protocols and methodology as used for soil sample collection during the 2019 RI sampling events. Detailed procedures used were developed using guidelines from the USACE guidelines (USACE, 2009), the ITRC for *Environmental Management at Operating Outdoor Small Arms Firing Ranges* (ITRC, 2005), and ITRC *Technical and Regulatory Guidance: Incremental Sampling Methodology Update ISM-2* (ITRC, 2020). ISM soil sample collection procedures used during the RI Addendum at each parcel are summarized below.

Following ISM grid delineation, a systematic random sampling approach was used to collect the surface soil samples (0 to 2 inches), and subsurface soil samples (0 to 1-foot, and 1-foot to 2 feet). The location of each borehole cored was GPS recorded (Attachment 1).

The 30 parcels, including the four sub-parcels [(APN 310-21-063(A-K), APN 310-21-078 (A-N), APN 310-38-002(A-Q), and APN 310-40-005(A-O)] and subdivided easement [Thompson easement (ThompA through ThompQ)], sampled between January 21, 2020 and April 8, 2021, are listed in Table 2-1 and depicted in Figure 2-1.

Phase II Sampling

During the advancement of soil borings, skeet fragments were observed at 2 feet bgs at two (2) sub-divisions of Thompson easement (ThompK, and ThompN). Therefore, subsurface (2 feet to 3 feet bgs; DU-4) soil samples and subsurface (3 feet to 4 feet bgs: DU-5) soil samples were collected. Sample collection at these deeper depths was conducted in a similar manner as described for the 0 to 1-foot and 1-foot to 2 feet bgs intervals, properly labeled and preserved on ice in coolers, submitted to Eurofins TestAmerica-Denver, and analyzed for USEPA Method 8270C SIM and USEPA Method 6010B. Results of the deeper sampling depth intervals from the parcel and easement are discussed in Section 4.

As discussed before, when analytical results from the 1-foot to 2 feet depth intervals indicated above screening levels for PAHs and/or metals, as a part of Phase II sampling, parcels were sampled at deeper depth intervals. The following additional parcels required resampling during the sampling activities completed between January 21, 2021 and April 8, 2021:

- Parcel with APN 32436017 indicated PAHs above screening levels during Phase I sampling from analytical results reported from the 1 to 2 feet depth interval. Therefore, this parcel was sampled at depth intervals from 2 to 3 feet bgs and 3 feet to 4 feet bgs during Phase II sampling.

- Subdivided Thompson easement 'ThompJ', 'ThompK' 'ThompL', and 'ThompM' indicated PAHs above screening levels during Phase I sampling from analytical results reported from the 1 to 2 feet depth interval. Therefore, was sampled at depth intervals from 2 to 3 feet bgs and 3 feet to 4 feet bgs during Phase II sampling.

- Due to analytical soil sample results from the 1-foot to 2 feet, 2 feet to 3 feet, and 3 feet to 4 feet depth intervals with PAHs above screening levels, subdivided Thompson easement 'ThompJ', 'ThompK' 'ThompL', and 'ThompM' required additional, deeper subsurface sampling from 4 feet to 5 feet bgs and 5 feet to 6 feet bgs sample depth intervals.

3.4 LABORATORY ANALYSES AND DATA VALIDATION

Samples were analyzed for PAHs by USEPA Method 8270C SIM and for metals (antimony, copper, lead, and zinc) by USEPA Method 6010B. Soil samples received at the laboratory were dried, mechanically ground, and incrementally sampled, followed by digestion according to laboratory standard operation procedure (SOPs) and USEPA Method 6010B. The soil samples were processed through the same ISM procedure except for the grinding step, as documented via FCRF-001 and FCRF-002. Following ISM, samples were extracted and analyzed according to USEPA Method 8270C using gas chromatography/mass spectrometry (GC/MS) in SIM mode. COPCs were reported in mg/kg for metals and µg/kg for PAHs. A data quality summary is presented in Appendix B.

Quality control exceedances are discussed in detail in Appendix B. Relevant data validation qualifiers (i.e., "J"; "U"; and "UJ") are defined in the data validation reports provided in

Attachment 1 as a part of the respective RI Addendum parcel reports. The quality and usability of analytical data collected for RI Addendum activities are discussed in Appendix B.

3.5 RESTORATION

Boreholes from each RI Addendum parcel investigated were backfilled with soil cuttings from the same boring and compacted by hand. The ground surface was smoothed to match the existing grade. Temporary Site survey markers used for sampling delineation at each parcel were removed. Parcel restoration photographs were taken at each parcel and the location of each borehole cored was GPS recorded. provided in Attachment 1 as a part of the parcel reports. Photographs and GPS data are provided in Attachment 1 as a part of the respective RI Addendum parcel reports.

3.6 LAND SURVEYS

Parcel corner boundaries, SU boundaries, location of skeet fragments and/or lead shotgun pellets, and location of subsurface soil borings were surveyed at each parcel using a Trimble Geo 7X GPS receiver. Decimeter level accuracy level position was performed using the Global Navigation Satellite System (GNSS) using the NOREAS SOP. In addition, the cored borehole locations were recorded using the GNSS device with a corresponding borehole identifier. All notations, including any clay pigeon fragments within the boreholes, were accurately reported. The total surface area of each parcel boundary was also calculated by using the area calculation tool on the Geo7X GPS receiver based on the positions of the corners of the parcel, as surveyed. Post-collection differential corrections were applied to the GPS data using Trimble Pathfinder™ software. GPS positions and points recorded by parcel, including skeet fragment locations and boreholes, are presented in the respective parcel reports in Attachment 1.

For the location of the RI Addendum properties, horizontal coordinates were provided in US survey feet within State Plane Coordinate System based on the North American Datum of 1983 (NAD 83) reference. Vertical coordinates were reported in US feet elevations based on the North American Vertical Datum (NAVD 88) of 1988 reference.

4 INVESTIGATION RESULTS

This section provides the results of the RI Addendum activities conducted between January 2020 and April 2021, at the Site.

- A total of 1,013 soil samples were collected from 30 parcels and one easement during the RI Addendum phase, between January 21, 2020, and April 8, 2021. Of these, due to size, three (3) of the parcels and the easement were subdivided into sub-parcels APN 310-21-063(A-K), APN 310-21-078(A-N) APN 310-38-002(A-Q), APN 310-40-005(A-O), and Thompson Easement was divided into Thomp (A-Q). Additionally, seven (7) of the parcels were resampled due to rejected data collected during RI activities between January 15, 2019 and October 31, 2019.

The following subsections include a discussion of visual observation of skeet fragment debris and lead shot pellets, and soil sampling results.

4.1 VISUALLY-OBSERVED SKEET AND MUNITIONS COMPONENTS

Clay pigeon fragments were identified visually by 1) distinct black color; 2) circular-like patterns or raised printed text on black pieces; 3) distinct black "streak" left when rubbed against a hard rough surface and 4) proclivity to be found in "cluster" of several black fragments. Figure 4-1 depicts visually observed skeet fragments for all RI and RI addendum parcels and easement investigated.

4.1.1 Skeet Fragment Observations

During the RI Addendum, skeet fragments were visually observed on 8 of the 30 parcels' and on the easement's surface, including the three of the four subdivided parcels [APN 310-21-063(A-K), 310-21-078(A-N), APN 310-38-002(A-Q) and subdivision of Thompson Easement (A-Q)], investigated by NOREAS between January 21, 2020, and April 8, 2021 (Figure 4-1). Skeet fragments were also visually observed on 44[5] of the 60 parcels' surfaces (Figure 4-1), investigated by NOREAS between January 15, 2019, and October 31, 2020, and visually observed on 21 of the

[5] Parcels APN 310-21-063, APN 310-210-078, and APN 310-38-002 were further subdivided during RI Addendum field activities.

66 parcels' surfaces during the RI activities conducted between December 2014 and February 2017 performed by ECO. Surface skeet fragment observations by parcel APNs and SUs are provided in Table 4-1 below. Locations of SUs on each of the 30 parcels and one easement evaluated in this RI Addendum are included in the respective RI Addendum parcel reports (Attachment 1).

(W) west section of subdivided parcel

During the RI Addendum, skeet fragments were visually observed in the subsurface of 1 of the 30 parcels' and in the easement subsurface. Skeet fragments were also visually observed in the subsurface during sampling in 8 of the 60 RI parcels conducted between January to October 2019, and in 5 of the 66 RI parcels investigated between December 2014 to February 2017. Subsurface skeet fragment observations by parcel are provided in Table 4-2 below.

(W) west section of subdivided parcel

Of the 39 parcels and one easement investigated outside of the original 284 parcels identified for RI, 18 of these parcels has visually observed clay pigeons/skeet fragments. Parcels located outside of the initial 284 parcels are listed in Table 4-3 below by APN, street number and address, and whether skeet fragments were observed.

4.1.2 Lead Shot Pellets

No munitions constituent (MC; lead shot pellets) affiliated with the Former 15 Skeet Ranges, Kingman GTG Gunnery Range military munitions use were observed at the Site during the RI or for this RI Addendum.

4.2 SOIL SAMPLING RESULTS – PAHs and Metals

Soil samples were analyzed for PAHs by USEPA Method 8270C- SIM. Table 4-4 summarizes PAH concentrations for the RI samples collected between January 21, 2020 and April 8, 2021. Soil samples were analyzed for metals (antimony, copper, lead, and zinc) by USEPA Method 6010B. Table 4-5 summarizes metals concentrations for the RI samples collected between January 21, 2020 and April 8, 2021.

Between January 21, 2020 and April 8, 2021, 1,013 soil samples collected from 30 parcels and one easement during the RI Addendum. Of these, due to size, four (4) of the parcels, and the easement were subdivided into sub-parcels APN 310-21-063(A-K), APN 310-21-078(A-N) APN 310-38-002(A-Q), APN 310-40-005(A-O), and Thompson Easement (A-Q). Additionally, seven (7) of the parcels were resampled due to rejected data collected during RI activities between January 15, 2019 and October 31, 2019 (Tables 4-4 and 4-5).

4.3 HUMAN HEALTH RISK ASSESSMENT

Potential health impacts associated with the contaminants detected in soil, HHRAs were prepared for each of the parcels investigated by NOREAS from January 15, 2019 to October 31, 2019, for parcels previously investigated by from 2014 to 2017 (NOREAS, 2021), and for RI addendum parcels and easement investigated from January 21, 2020 to April 8, 2021 (Appendix A). This section summarizes the HHRA findings. Additional details of the HHRA are presented in the Final RI Report (NOREAS, 2021), and Appendix A.

4.3.1 Hazard Identification

The primary concern at the Site is the abundant, but scattered clay pigeon debris. World War II-era clay pigeons were constructed with coal tar pitch, containing PAHs. Metals (antimony, copper, lead, and zinc) are associated with shotgun pellets.

At each parcel assessed, a constituent (PAH compound or metal) detected at least once was identified as a COPC and evaluated for potential health impacts.

4.3.2 Exposure Assessment

Currently, the Site is almost completely developed for residential purposes. Each of the parcels represent residential areas, therefore, the default residential exposure scenario of the USEPA (USEPA, 2020) was evaluated for this HHRA.

The default USEPA residential exposure scenario assumes a long-term resident and assumes a resident spends most, if not all, of the day at home. The resident is assumed to be exposed to contaminants via the following pathways: incidental ingestion of soil, dermal contact with soil, inhalation of volatiles and fugitive dust.

Exposure assessment required the use of USEPA Residential Screening Levels (RSLs) (USEPA, 2021)[6], exposure point concentrations (EPCs), and risk quantification (See Section 4.3.3 and Appendix A). To derive the EPCs, the 95 % UCL, based on the Chebyshev inequality method, was calculated using the USEPA ProUCL 5.1.002 software (USEPA, 2015). EPCs were estimated for two intervals, 0-1-foot interval, which describes potential current exposures at the parcels, and all

[6] Previous evaluations in the RI utilized the 2020 version of the RSLs. A comparison was made between 2020 and 2021 RSL values and no differences were identified for the COPCs.

depths, which is descriptive of potential future exposures where significant excavation and redistribution of the contaminants can occur (Appendix A; exhibit B [0-1-foot interval] and exhibit C [all depth interval]).

4.3.3 Risk Quantification

To quantify potential health risks, the USEPA RSLs were used to evaluate carcinogenic and noncarcinogenic health effects, as they are based on human health risk. The RSLs correspond to either a one in a million (10^{-6}) risk level for carcinogens or a Hazard Index (HI) of 1 for non-carcinogens. Carcinogenic COPCs are those that are known or suspected of causing cancer. Cancer effects are evaluated based on the assumption that any level of exposure to a carcinogenic compound can cause an effect. Noncarcinogenic COPCs are those that may result in deleterious health effects, other than cancer (Appendix A).

Environmental exposure to lead can affect multiple organs in the human body, however the nervous system is the mostly affected by lead toxicity. Childhood exposures to lead are of greater impact than adults because of tissue development and a decrease in cognitive performance and functions of the nervous system. To assess potential lead exposures, blood lead levels (BLLs) (i.e., concentration of lead in blood) are considered an indicator. The USEPA identifies a BLL of 10 micrograms of lead per deciliter of blood (µg/dl) as a level of concern. The USEPA has selected a residential 400 mg/kg standard because that is the level at which a child has a 1% to 5% risk of having a blood lead level of 10 µg/dl. A lead index value is calculated for each depth interval evaluated by dividing the EPC of lead by 400 mg/kg. A lead index of 1 or more would indicate a potential for excess exposure.

For parcels investigated from January 2019 to April 2021, risks are evaluated separately using data combined from the surface sampling and 0- to 1-foot depth, and from all-depths (Table 4-6).

4.3.4 Risk Results

The HHRA results are expressed as carcinogenic risk and noncarcinogenic hazard. Carcinogenic risks are expressed in terms of probabilities. That is, a probabilistic expression is calculated to indicate the number of cancers that can be expected within a population (the lower the number the lower the probability). For example, the probability expressed as 1×10^{-5} (10^{-5}) can be read as a probability of cancer of one in 100,000. The risk assessment represents a carcinogenic risk factor

of 10^{-6} for PAHs and using incremental lifetime cancer risk (ILCR) quantified as above 10^{-6} or at or below 10^{-6}.

For noncarcinogens, the indicator calculated is a noncarcinogenic hazard. The hazard is the ratio of the EPC divided by the COPC specific RSL, which is a level believed to be without deleterious health impacts to sensitive subpopulations. A total hazard less than unity, or one, is believed to be without adverse health effects to the most sensitive subpopulations.

The results of the HHRA January 2019 to April 2021 RI parcels and easement are presented in Table 4-6. The HHRA for all parcels sample during RI and RI Addendum (April 2013 to April 2021) are summarized on Figure 4-2. A total of 79 parcels and easement of the 151 RI parcels and easement were quantified with an ILCR above 10^{-6}. The highest ILCR ($5x10^{-4}$) was found at the Thompson Easement L. The presence of skeet fragments was noted on the surface of 71 and in the subsurface of 15 of the 151 RI parcels and easement investigated between December 2014 and April 2021 (Tables 4-1 and 4-2 above, and Figures 4-1 and 4-2).

The Thompson Easement L was also found to have COPC concentrations resulting in non-carcinogenic hazard quotient (HQ) greater than 1 at the 0 to 1-foot interval. All other parcels had noncarcinogenic HQs of 1 or less. Lead concentrations were found to be below the USEPA RSL of 400 mg/kg at all parcels.

4.3.5 Uncertainties and Limitations of the HHRA

Various uncertainties are associated with the results of the HHRA, and are detailed in Appendix A. Significant limitations are associated with sampling; most significantly, samples were not collected beneath homes. As such, changes in land use may expose additional areas containing COPCs. The most prominent limitation of the HHRA is that soil sampling necessarily excluded larger clay pigeon debris (skeet fragments) from chemical analysis. The presence of significant clay pigeon debris at a parcel represents an on-going source of contamination both through direct exposure (ingestion) and the potential to contribute to soil contamination following further weathering/disintegration of this material. Figure 4-2 presents a summary of the results of all RI parcels and easement reported risk factors and overlays visual observations of skeet fragments at a parcel. Observations of skeet fragments are not consistently correlated with the calculated risks for a parcel.

Abbreviations and Notes:
(A) - letter designates that due to size of parcel, parcel was subdivided into sub-parcels
-- Not applicable (open area)
* parcel was resampled due to rejected data
APN - Assessor parcel number
Ave - Avenue
ISM - Incremental sampling method

Notes:
'* parcel was resampled during the RI Addendum field activities due to rejected data in 2019 RI activities
(A) - letter designates that due to size of parcel, parcel was subdivided into sub-parcels or easement subdivision
APN - Assessor's Parcel Number
J - estimated value; the analyte was positively identified
U - not detected above the limit of detection
UJ - estimated non-detect
X - rejected data
µg/kg - microgram per kilogram
bolded exceeds screening value

Notes:
* parcel was resampled during the RI Addendum field activities due to rejected data in 2019 RI activities
(A) - letter designates that due to size of parcel, parcel was subdivided into sub-parcels or easement subdivision
APN - Assessor's Parcel Number
U - not detected above the limit of detection
UJ - estimated non-detect
X - rejected data
mg/kg - milligrams per kilogram

Bold = concentration of potential concern (COPC) concentrations resulting in estimated ILCR in excess of $1x10^{-6}$ or noncarcinogenic HQ greater than 1

* surface samples were collected in the 2014-2017 RI

'-- Sampled in open area

(A) - letter designates that due to size of parcel, parcel was subdivided into sub-parcels or easement subdivision

N/A - only surface soil detection necessary

** parcel was resampled during the RI Addendum field activities due to rejected data in 2019 RI activities

Ave - Avenue

ILCR - Incremental Lifetime Cancer Risk

ISM - Incremental sampling method

Parcels 31021063, 31021078, and 31008002 were sampled during the 2019 RI. Subparcels for the above listed parcels were sampled during the 2020 and 2021 Addendum RI.

*Parcel 32404643 was sampled at 2 feet bgs during theTCRA, and later was sampled at 3-foot and 4-foot depth intervals during the 2014-2017 RI field investigations.

Parcels 32404639 and 32404640 were investigated on the surface in the 2014 -2017 RI. The subsurface was investigated during the 2019 RI.

Note:

- Parcels Sampled 2019 RI (NOREAS)
- Parcels Sampled 2020-2021 RI Addendum (NOREAS)
- Skeet Fragments Observed*
- Skeet Fragments Observed in Parcel **

Note:

* The locations of visually observed skeet on the surface are denoted with red dots. These locations include the July 2017 reconnaissance, and parcel 31021080 (north of Thompson Ave and east of Rose Dr).

** All other parcels denote the observation of skeet in any DU surface or subsurface with a diamond symbol, and do not indicate the exact observed locations. Refer to the individual parcels reports for details regarding surface skeet locations

Skeet observed in TCRA parcels during RI activities will be addressed in a subsequent field event to evaluate the extent of skeet remaining on TCRA parcels.

Parcels 32404639 and 32404640 were investigated on the surface in the previous RI, the subsurface was investigated during the current RI.

- Skeet Fragments Observed*
- Skeet Fragments Observed in Parcel**

RI Parcels - Incremental Lifetime Cancer Risk

- less than 10^{-6}
- more than 10^{-6}

Note:

* The locations of visually observed skeet on the surface are denoted with red dots. These locations include the July 2017 reconnaissance, and parcel 31021080 (north of Thompson Ave and east of Rose Dr).

** All other parcels denote the observation of skeet in any DU surface or subsurface with a diamond symbol, and do not indicate the exact observed locations. Refer to the individual parcels reports for details regarding surface skeet locations

Skeet observed in TCRA parcels during RI activities will be addressed in a subsequent field event to evaluate the extent of skeet remaining on TCRA parcels.

Parcels 32404639 and 32404640 were investigated on the surface in the previous RI, the subsurface was investigated during the current RI.

APPENDIX A

HUMAN HEALTH RISK ASSESSMENT FOR RI ADDENDUM PARCELS

This page intentionally left blank.

APPENDIX A

Human Health Risk Estimates for RI Addendum Parcels

This Appendix to the Addendum to Remedial Investigation (RI)[1] for the Kingman Ground to Ground Gunnery Range in Mohave County includes the human health risk estimates for the parcels investigated from January 2020 to April 2021.

The methods used to estimate these potential health impacts are presented in Appendix B of the RI. In summary, the health estimating methods required the use of EPA Regional Screening Levels (RSLs)[2], the estimation of exposure point concentrations (EPCs), and risk quantification. Table 1 summarizes all carcinogenic and non-carcinogenic health risks for each parcel. Individual worksheets[3] identifying RSLs, EPCs and are provided as Exhibit A to this Appendix.

To derive the EPCs, the 95th percentile upper confidence limit (UCL), based on the Chebyshevs inequalitiy method, was calculated using the EPA ProUCL software[4]. EPCs were estimated for two intervals, 0-1, which describes potential current exposures at the parcels, and all depths, which is descriptive of potential future exposures where significant excavation and redistribution of the contaminants can occur. The ProUCL output files[5] are included as Exhibits B (0 to 1-foot interval) and Exhibit C (all depth interval).

Theoretical upper-bound incremental lifetime cancer risks (ILCRs) for carcinogenic constituents and hazard quotients (HQs) for non-carcinogenic constituents were calculated by dividing the EPCs in soil by the RSL. The ILCR are expressed in terms of probabilities. That is, a probabilistic expression is calculated to indicate the number of cancers that can be expected within a population (the lower the number the lower the probability). For example, the probability expressed as $1x10^{-5}$ can be read as a probability of cancer of one in 100,000. As a point of reference, carcinogenic risk probabilities ranging from 10^{-4} to 10^{-6} are generally considered acceptable by USEPA (National Oil and Hazardous Substances Contingency Plan; 40 Code of

[5] Each ProUCL output file is identified with the last 5 APN numbers, and can be cross referenced to Table 1 of this Appendix.

Federal Regulations 300.430). Additional risk management criteria are to be discussed within the Feasibility Study.

For noncarcinogens, the indicator calculated is a noncarcinogenic HQ. The HQ is the ratio of the EPC divided by the COPC specific RSL, which is a level believed to be without deleterious health impacts to sensitive subpopulations. A total HQ (sum of individual HQs) less than unity, or one, is believed to be without adverse health effects to the most sensitive subpopulations.

Of the 30 parcels and easement evaluated[6], including sub-parcels and subdivisions of Thompson easement, 5 parcels and easement were found to have COPC concentrations resulting in estimated ILCR in excess of $1x10^{-6}$ (Table 1). The highest ILCR ($5x10^{-4}$) was found at the Thompson Easement L. The detected concentrations of PAHs contributed to the risks at this location under the evaluation of both depth intervals. The Thompson Easement L parcel was also found to have COPC concentrations resulting in noncarcinogenic HQ greater than one at the 0 to 1-foot interval. All other parcels had noncarcinogenic HQs of 1 or less. Lead concentrations were found to be below the USEPA residential soil screening level of 400 mg/kg at all parcels. Table 1 summarizes all carcinogenic and non-carcinogenic health risks for each parcel, and Exhibit A identifies the risks from each individual chemical at each parcel location for each depth investigated.

[6] RI addendum parcels, parcel APN 310-21-063[(A-K); 11 sub-parcels], APN 310-21-078 [(A-N); 14 sub-parcels], APN 310-38-002 [(A-Q); 17 sub-parcels], and 310-40-005 [(A-O); 15 sub-parcels)], and Thompson easement [(A-Q); 17 subdivisions] were subdivided.

Nonparametric UCL Statistics for Uncensored Full Data Sets

User Selected Options	
Date/Time of Computation	ProUCL 5.17/20/2021 11:53:15 AM
From File	21063A.xls
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

COPPER

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	11.2	Mean	13.38
Maximum	14.2	Median	13.65
SD	1.105	Std. Error of Mean	0.451
Coefficient of Variation	0.0826	Skewness	-2.1
Mean of logged Data	2.591	SD of logged Data	0.0881

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data do not follow a Discernible Distribution (0.05)

Assuming Normal Distribution

95% Normal UCL		95% UCLs (Adjusted for Skewness)	
95% Student's-t UCL	14.29	95% Adjusted-CLT UCL (Chen-1995)	13.71
		95% Modified-t UCL (Johnson-1978)	14.23

Nonparametric Distribution Free UCLs

95% CLT UCL	14.13	95% Jackknife UCL	14.29
95% Standard Bootstrap UCL	14.05	95% Bootstrap-t UCL	13.94
95% Hall's Bootstrap UCL	13.8	95% Percentile Bootstrap UCL	13.93
95% BCA Bootstrap UCL	13.87		
90% Chebyshev(Mean, Sd) UCL	14.74	95% Chebyshev(Mean, Sd) UCL	15.35
97.5% Chebyshev(Mean, Sd) UCL	16.2	99% Chebyshev(Mean, Sd) UCL	17.87

Suggested UCL to Use

95% Student's-t UCL	14.29	or 95% Modified-t UCL	14.23

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

LEAD

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	9.14	Mean	11.19
Maximum	12.6	Median	11.25

SD	1.251	Std. Error of Mean	0.511
Coefficient of Variation	0.112	Skewness	-0.711
Mean of logged Data	2.41	SD of logged Data	0.116

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

97.5% Chebyshev(Mean, Sd) UCL	16.14	99% Chebyshev(Mean, Sd) UCL	16.83

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

95% BCA Bootstrap UCL	11.81		
90% Chebyshev(Mean, Sd) UCL	15.07	95% Chebyshev(Mean, Sd) UCL	17.63
97.5% Chebyshev(Mean, Sd) UCL	21.2	99% Chebyshev(Mean, Sd) UCL	28.19

Suggested UCL to Use

Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

COPPER

General Statistics

Total Number of Observations	6	Number of Distinct Observations	5
		Number of Missing Observations	0
Minimum	12.5	Mean	13.38
Maximum	14.4	Median	13.4
SD	0.714	Std. Error of Mean	0.291
Coefficient of Variation	0.0533	Skewness	0.149
Mean of logged Data	2.593	SD of logged Data	0.0533

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		95% UCLs (Adjusted for Skewness)	
95% Student's-t UCL	13.97	95% Adjusted-CLT UCL (Chen-1995)	13.88
		95% Modified-t UCL (Johnson-1978)	13.97

Nonparametric Distribution Free UCLs

95% CLT UCL	13.86	95% Jackknife UCL	13.97
95% Standard Bootstrap UCL	13.82	95% Bootstrap-t UCL	14
95% Hall's Bootstrap UCL	13.95	95% Percentile Bootstrap UCL	13.82
95% BCA Bootstrap UCL	13.78		
90% Chebyshev(Mean, Sd) UCL	14.26	95% Chebyshev(Mean, Sd) UCL	14.65
97.5% Chebyshev(Mean, Sd) UCL	15.2	99% Chebyshev(Mean, Sd) UCL	16.28

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

LEAD

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	10.9	Mean	13.2
Maximum	15.7	Median	12.95
SD	2.298	Std. Error of Mean	0.938
Coefficient of Variation	0.174	Skewness	0.0868
Mean of logged Data	2.568	SD of logged Data	0.175

Note: Sample size is small (e.g., <10), if data are collected using ISM approach

you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	15.09	95% Adjusted-CLT UCL (Chen-1995)	14.78
		95% Modified-t UCL (Johnson-1978)	15.1

Nonparametric Distribution Free UCLs

95% CLT UCL	14.74	95% Jackknife UCL	15.09
95% Standard Bootstrap UCL	14.6	95% Bootstrap-t UCL	14.98
95% Hall's Bootstrap UCL	14.03	95% Percentile Bootstrap UCL	14.62
95% BCA Bootstrap UCL	14.6		
90% Chebyshev(Mean, Sd) UCL	16.01	95% Chebyshev(Mean, Sd) UCL	17.29
97.5% Chebyshev(Mean, Sd) UCL	19.06	99% Chebyshev(Mean, Sd) UCL	22.53

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ZINC

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	44.3	Mean	46.02
Maximum	47.7	Median	45.95
SD	1.107	Std. Error of Mean	0.452
Coefficient of Variation	0.0241	Skewness	-0.0463
Mean of logged Data	3.829	SD of logged Data	0.0241

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	46.93	95% Adjusted-CLT UCL (Chen-1995)	46.75
		95% Modified-t UCL (Johnson-1978)	46.93

Nonparametric Distribution Free UCLs

95% CLT UCL	46.76	95% Jackknife UCL	46.93
95% Standard Bootstrap UCL	46.7	95% Bootstrap-t UCL	46.94
95% Hall's Bootstrap UCL	47.16	95% Percentile Bootstrap UCL	46.7
95% BCA Bootstrap UCL	46.68		
90% Chebyshev(Mean, Sd) UCL	47.37	95% Chebyshev(Mean, Sd) UCL	47.99
97.5% Chebyshev(Mean, Sd) UCL	48.84	99% Chebyshev(Mean, Sd) UCL	50.51

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

2-METHYLNAPHTHALENE

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	0.823	Mean	1.46
Maximum	3.64	Median	1.072
SD	1.079	Std. Error of Mean	0.44
Coefficient of Variation	0.739	Skewness	2.341
Mean of logged Data	0.225	SD of logged Data	0.543

Note: Sample size is small (e.g., <10), if data are collected using ISM approach you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data do not follow a Discernible Distribution (0.05)

Assuming Normal Distribution

Assuming Normal Distribution

95% Normal UCL		95% UCLs (Adjusted for Skewness)	
95% Student's-t UCL	13.09	95% Adjusted-CLT UCL (Chen-1995)	12.9
		95% Modified-t UCL (Johnson-1978)	13.07

Nonparametric Distribution Free UCLs

95% CLT UCL	13.01	95% Jackknife UCL	13.09
95% Standard Bootstrap UCL	12.97	95% Bootstrap-t UCL	12.98
95% Hall's Bootstrap UCL	12.94	95% Percentile Bootstrap UCL	12.97
95% BCA Bootstrap UCL	12.92		
90% Chebyshev(Mean, Sd) UCL	13.31	95% Chebyshev(Mean, Sd) UCL	13.6
97.5% Chebyshev(Mean, Sd) UCL	14.02	99% Chebyshev(Mean, Sd) UCL	14.83

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

97.5% Chebyshev(Mean, Sd) UCL	18.54	99% Chebyshev(Mean, Sd) UCL	19.83

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

90% Chebyshev(Mean, Sd) UCL	14.78	95% Chebyshev(Mean, Sd) UCL	14.95
97.5% Chebyshev(Mean, Sd) UCL	15.18	99% Chebyshev(Mean, Sd) UCL	15.63

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	77.77	95% Adjusted-CLT UCL (Chen-1995)	72.77
		95% Modified-t UCL (Johnson-1978)	77.77

Nonparametric Distribution Free UCLs

95% CLT UCL	72.79	95% Jackknife UCL	77.77
95% Standard Bootstrap UCL	70.65	95% Bootstrap-t UCL	78.81
95% Hall's Bootstrap UCL	62.48	95% Percentile Bootstrap UCL	71
95% BCA Bootstrap UCL	71.5		
90% Chebyshev(Mean, Sd) UCL	91.02	95% Chebyshev(Mean, Sd) UCL	109.3
97.5% Chebyshev(Mean, Sd) UCL	134.7	99% Chebyshev(Mean, Sd) UCL	184.5

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

FLUORENE

General Statistics

Total Number of Observations	6	Number of Distinct Observations	4
		Number of Missing Observations	0
Minimum	1.185	Mean	1.223
Maximum	1.305	Median	1.2
SD	0.0452	Std. Error of Mean	0.0185
Coefficient of Variation	0.037	Skewness	1.574
Mean of logged Data	0.2	SD of logged Data	0.0363

Note: Sample size is small (e.g., <10), if data are collected using ISM approach you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics

Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

COPPER

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	11.8	Mean	12.97
Maximum	14.6	Median	12.7
SD	1.023	Std. Error of Mean	0.418
Coefficient of Variation	0.0789	Skewness	0.775
Mean of logged Data	2.56	SD of logged Data	0.0776

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		95% UCLs (Adjusted for Skewness)	
95% Student's-t UCL	13.81	95% Adjusted-CLT UCL (Chen-1995)	13.79
		95% Modified-t UCL (Johnson-1978)	13.83

Nonparametric Distribution Free UCLs

95% CLT UCL	13.65	95% Jackknife UCL	13.81
95% Standard Bootstrap UCL	13.59	95% Bootstrap-t UCL	14.53
95% Hall's Bootstrap UCL	18.5	95% Percentile Bootstrap UCL	13.63
95% BCA Bootstrap UCL	13.63		
90% Chebyshev(Mean, Sd) UCL	14.22	95% Chebyshev(Mean, Sd) UCL	14.79
97.5% Chebyshev(Mean, Sd) UCL	15.57	99% Chebyshev(Mean, Sd) UCL	17.12

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

LEAD

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	17.2	Mean	62.25
Maximum	129	Median	56.75
SD	40.49	Std. Error of Mean	16.53
Coefficient of Variation	0.65	Skewness	0.811
Mean of logged Data	3.933	SD of logged Data	0.72

Note: Sample size is small (e.g., <10), if data are collected using ISM approach

you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	95.56	95% Adjusted-CLT UCL (Chen-1995)	95.29
		95% Modified-t UCL (Johnson-1978)	96.47

Nonparametric Distribution Free UCLs

95% CLT UCL	89.44	95% Jackknife UCL	95.56
95% Standard Bootstrap UCL	87.39	95% Bootstrap-t UCL	109.4
95% Hall's Bootstrap UCL	94.79	95% Percentile Bootstrap UCL	88.28
95% BCA Bootstrap UCL	92.92		
90% Chebyshev(Mean, Sd) UCL	111.8	95% Chebyshev(Mean, Sd) UCL	134.3
97.5% Chebyshev(Mean, Sd) UCL	165.5	99% Chebyshev(Mean, Sd) UCL	226.7

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ZINC

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	41.7	Mean	46.3
Maximum	50.1	Median	46.45
SD	2.721	Std. Error of Mean	1.111
Coefficient of Variation	0.0588	Skewness	-0.618
Mean of logged Data	3.834	SD of logged Data	0.0597

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	48.54	95% Adjusted-CLT UCL (Chen-1995)	47.83
		95% Modified-t UCL (Johnson-1978)	48.49

Nonparametric Distribution Free UCLs

95% CLT UCL	48.13	95% Jackknife UCL	48.54
95% Standard Bootstrap UCL	47.96	95% Bootstrap-t UCL	48.08
95% Hall's Bootstrap UCL	48.08	95% Percentile Bootstrap UCL	47.95
95% BCA Bootstrap UCL	47.73		
90% Chebyshev(Mean, Sd) UCL	49.63	95% Chebyshev(Mean, Sd) UCL	51.14
97.5% Chebyshev(Mean, Sd) UCL	53.24	99% Chebyshev(Mean, Sd) UCL	57.35

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

2-METHYLNAPHTHALENE

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	0.649	Mean	0.989
Maximum	1.71	Median	0.938
SD	0.379	Std. Error of Mean	0.155
Coefficient of Variation	0.383	Skewness	1.728
Mean of logged Data	-0.0627	SD of logged Data	0.339

Note: Sample size is small (e.g., <10), if data are collected using ISM approach you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Approximate Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		95% UCLs (Adjusted for Skewness)

you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	32.11	95% Adjusted-CLT UCL (Chen-1995)	28.85
		95% Modified-t UCL (Johnson-1978)	31.86

Nonparametric Distribution Free UCLs

95% CLT UCL	30.45	95% Jackknife UCL	32.11
95% Standard Bootstrap UCL	29.75	95% Bootstrap-t UCL	30.43
95% Hall's Bootstrap UCL	27.72	95% Percentile Bootstrap UCL	29.6
95% BCA Bootstrap UCL	28.25		
90% Chebyshev(Mean, Sd) UCL	36.51	95% Chebyshev(Mean, Sd) UCL	42.58
97.5% Chebyshev(Mean, Sd) UCL	51.01	99% Chebyshev(Mean, Sd) UCL	67.56

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Nonparametric Distribution Free UCLs

95% CLT UCL	16.92	95% Jackknife UCL	17.15
95% Standard Bootstrap UCL	16.82	95% Bootstrap-t UCL	17.14
95% Hall's Bootstrap UCL	16.53	95% Percentile Bootstrap UCL	16.82
95% BCA Bootstrap UCL	16.85		
90% Chebyshev(Mean, Sd) UCL	17.76	95% Chebyshev(Mean, Sd) UCL	18.6
97.5% Chebyshev(Mean, Sd) UCL	19.77	99% Chebyshev(Mean, Sd) UCL	22.06

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	51	Mean	57.25
Maximum	65.8	Median	57.55
SD	5.188	Std. Error of Mean	2.118
Coefficient of Variation	0.0906	Skewness	0.637
Mean of logged Data	4.044	SD of logged Data	0.0894

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	61.52	95% Adjusted-CLT UCL (Chen-1995)	61.32
		95% Modified-t UCL (Johnson-1978)	61.61

Nonparametric Distribution Free UCLs

95% CLT UCL	60.73	95% Jackknife UCL	61.52
95% Standard Bootstrap UCL	60.45	95% Bootstrap-t UCL	62.19
95% Hall's Bootstrap UCL	61.98	95% Percentile Bootstrap UCL	60.58
95% BCA Bootstrap UCL	60.72		
90% Chebyshev(Mean, Sd) UCL	63.6	95% Chebyshev(Mean, Sd) UCL	66.48

97.5% Chebyshev(Mean, Sd) UCL	70.48	99% Chebyshev(Mean, Sd) UCL	78.33

Suggested UCL to Use

Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

2-METHYLNAPHTHALENE

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	0.775	Mean	0.896
Maximum	0.97	Median	0.916
SD	0.0819	Std. Error of Mean	0.0335
Coefficient of Variation	0.0915	Skewness	-0.55
Mean of logged Data	-0.114	SD of logged Data	0.0934

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics

Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	0.963	95% Adjusted-CLT UCL (Chen-1995)	0.943
		95% Modified-t UCL (Johnson-1978)	0.962

		95% Modified-t UCL (Johnson-1978)	1.297

Nonparametric Distribution Free UCLs

95% CLT UCL	1.295	95% Jackknife UCL	1.298
95% Standard Bootstrap UCL	N/A	95% Bootstrap-t UCL	N/A
95% Hall's Bootstrap UCL	N/A	95% Percentile Bootstrap UCL	N/A
95% BCA Bootstrap UCL	N/A		
90% Chebyshev(Mean, Sd) UCL	1.306	95% Chebyshev(Mean, Sd) UCL	1.317
97.5% Chebyshev(Mean, Sd) UCL	1.333	99% Chebyshev(Mean, Sd) UCL	1.364

Suggested UCL to Use

95% Student's-t UCL	1.298	or 95% Modified-t UCL	1.297

Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

97.5% Chebyshev(Mean, Sd) UCL	67.13	99% Chebyshev(Mean, Sd) UCL	91.47

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be
reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	1.311	95% Adjusted-CLT UCL (Chen-1995)	1.294
		95% Modified-t UCL (Johnson-1978)	1.309

Nonparametric Distribution Free UCLs

95% CLT UCL	1.305	95% Jackknife UCL	1.311
95% Standard Bootstrap UCL	1.303	95% Bootstrap-t UCL	1.302
95% Hall's Bootstrap UCL	1.297	95% Percentile Bootstrap UCL	1.301
95% BCA Bootstrap UCL	1.297		
90% Chebyshev(Mean, Sd) UCL	1.325	95% Chebyshev(Mean, Sd) UCL	1.344
97.5% Chebyshev(Mean, Sd) UCL	1.371	99% Chebyshev(Mean, Sd) UCL	1.425

Suggested UCL to Use

Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

90% Chebyshev(Mean, Sd) UCL	101.8	95% Chebyshev(Mean, Sd) UCL	112.7
97.5% Chebyshev(Mean, Sd) UCL	127.7	99% Chebyshev(Mean, Sd) UCL	157.1

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ZINC

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	58.9	Mean	63.48
Maximum	67.5	Median	64.15
SD	3.809	Std. Error of Mean	1.555
Coefficient of Variation	0.06	Skewness	-0.372
Mean of logged Data	4.149	SD of logged Data	0.0605

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

Nonparametric Distribution Free UCLs

95% CLT UCL	26.3	95% Jackknife UCL	29.73
95% Standard Bootstrap UCL	24.82	95% Bootstrap-t UCL	5786
95% Hall's Bootstrap UCL	2408	95% Percentile Bootstrap UCL	29.29
95% BCA Bootstrap UCL	30.22		
90% Chebyshev(Mean, Sd) UCL	38.85	95% Chebyshev(Mean, Sd) UCL	51.42
97.5% Chebyshev(Mean, Sd) UCL	68.88	99% Chebyshev(Mean, Sd) UCL	103.2

Suggested UCL to Use

95% Hall's Bootstrap UCL 2408

Recommended UCL exceeds the maximum observation

In Case Bootstrap t and/or Hall's Bootstrap yields an unreasonably large UCL value, use 97.5% or 99% Chebyshev (Mean, Sd) UCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

95% Student's-t UCL	1.307	95% Adjusted-CLT UCL (Chen-1995)	1.297
		95% Modified-t UCL (Johnson-1978)	1.306

Nonparametric Distribution Free UCLs

95% CLT UCL	1.302	95% Jackknife UCL	1.307
95% Standard Bootstrap UCL	1.299	95% Bootstrap-t UCL	1.304
95% Hall's Bootstrap UCL	1.293	95% Percentile Bootstrap UCL	1.299
95% BCA Bootstrap UCL	1.297		
90% Chebyshev(Mean, Sd) UCL	1.322	95% Chebyshev(Mean, Sd) UCL	1.343
97.5% Chebyshev(Mean, Sd) UCL	1.371	99% Chebyshev(Mean, Sd) UCL	1.427

Suggested UCL to Use

Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

INDENO(1,2,3-CD)PYRENE

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	2.62	Mean	3.149

95% Hall's Bootstrap UCL	68.31	95% Percentile Bootstrap UCL	21.33
95% BCA Bootstrap UCL	21.95		
90% Chebyshev(Mean, Sd) UCL	25.43	95% Chebyshev(Mean, Sd) UCL	30.56
97.5% Chebyshev(Mean, Sd) UCL	37.67	99% Chebyshev(Mean, Sd) UCL	51.63

Suggested UCL to Use

95% Chebyshev (Mean, Sd) UCL	30.56

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ZINC

General Statistics

Total Number of Observations	6	Number of Distinct Observations	5
		Number of Missing Observations	0
Minimum	27.2	Mean	38.53
Maximum	45.4	Median	39.5
SD	6.451	Std. Error of Mean	2.633
Coefficient of Variation	0.167	Skewness	-1.142
Mean of logged Data	3.638	SD of logged Data	0.183

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	43.84	95% Adjusted-CLT UCL (Chen-1995)	41.55
		95% Modified-t UCL (Johnson-1978)	43.64

Nonparametric Distribution Free UCLs

97.5% Chebyshev(Mean, Sd) UCL	1.432	99% Chebyshev(Mean, Sd) UCL	1.53

Suggested UCL to Use

Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	10.43	95% Adjusted-CLT UCL (Chen-1995)	9.461
		95% Modified-t UCL (Johnson-1978)	10.36

Nonparametric Distribution Free UCLs

95% CLT UCL	9.904	95% Jackknife UCL	10.43
95% Standard Bootstrap UCL	9.709	95% Bootstrap-t UCL	10.04
95% Hall's Bootstrap UCL	9.212	95% Percentile Bootstrap UCL	9.648
95% BCA Bootstrap UCL	9.395		
90% Chebyshev(Mean, Sd) UCL	11.84	95% Chebyshev(Mean, Sd) UCL	13.78
97.5% Chebyshev(Mean, Sd) UCL	16.48	99% Chebyshev(Mean, Sd) UCL	21.77

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	1.975	Mean	6.444
Maximum	27.4	Median	2.135
SD	10.27	Std. Error of Mean	4.194
Coefficient of Variation	1.594	Skewness	2.443
Mean of logged Data	1.22	SD of logged Data	1.034

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data do not follow a Discernible Distribution (0.05)

Assuming Normal Distribution

95% Normal UCL		95% UCLs (Adjusted for Skewness)	
95% Student's-t UCL	14.89	95% Adjusted-CLT UCL (Chen-1995)	17.81
		95% Modified-t UCL (Johnson-1978)	15.59

Nonparametric Distribution Free UCLs

95% CLT UCL	13.34	95% Jackknife UCL	14.89
95% Standard Bootstrap UCL	12.83	95% Bootstrap-t UCL	615.2
95% Hall's Bootstrap UCL	336.3	95% Percentile Bootstrap UCL	14.76
95% BCA Bootstrap UCL	15.01		
90% Chebyshev(Mean, Sd) UCL	19.02	95% Chebyshev(Mean, Sd) UCL	24.72
97.5% Chebyshev(Mean, Sd) UCL	32.63	99% Chebyshev(Mean, Sd) UCL	48.17

Suggested UCL to Use

95% Hall's Bootstrap UCL 336.3

Recommended UCL exceeds the maximum observation

In Case Bootstrap t and/or Hall's Bootstrap yields an unreasonably large UCL value, use 97.5% or 99% Chebyshev (Mean, Sd) UCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

97.5% Chebyshev(Mean, Sd) UCL	12.81	99% Chebyshev(Mean, Sd) UCL	13.45

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

LEAD

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	9.68	Mean	10.6
Maximum	11.3	Median	10.65
SD	0.663	Std. Error of Mean	0.271
Coefficient of Variation	0.0625	Skewness	-0.294
Mean of logged Data	2.359	SD of logged Data	0.063

Note: Sample size is small (e.g., <10), if data are collected using ISM approach

you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	11.14	95% Adjusted-CLT UCL (Chen-1995)	11.01
		95% Modified-t UCL (Johnson-1978)	11.14

Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

BENZO(A)PYRENE

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	1.57	Mean	9.75
Maximum	44.2	Median	2.105
SD	16.98	Std. Error of Mean	6.931
Coefficient of Variation	1.741	Skewness	2.387
Mean of logged Data	1.382	SD of logged Data	1.281

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).

Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data do not follow a Discernible Distribution (0.05)

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	23.72	95% Adjusted-CLT UCL (Chen-1995)	28.37
		95% Modified-t UCL (Johnson-1978)	24.84

Nonparametric Distribution Free UCLs

95% CLT UCL	21.15	95% Jackknife UCL	23.72
95% Standard Bootstrap UCL	19.99	95% Bootstrap-t UCL	612.7
95% Hall's Bootstrap UCL	610.9	95% Percentile Bootstrap UCL	22.95
95% BCA Bootstrap UCL	23.89		
90% Chebyshev(Mean, Sd) UCL	30.54	95% Chebyshev(Mean, Sd) UCL	39.96
97.5% Chebyshev(Mean, Sd) UCL	53.04	99% Chebyshev(Mean, Sd) UCL	78.72

Suggested UCL to Use

95% Hall's Bootstrap UCL	610.9

Recommended UCL exceeds the maximum observation

In Case Bootstrap t and/or Hall's Bootstrap yields an unreasonably large UCL value, use 97.5% or 99% Chebyshev (Mean, Sd) UCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

COPPER

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	8.3	Mean	9.665
Maximum	11.4	Median	9.53
SD	1.148	Std. Error of Mean	0.469
Coefficient of Variation	0.119	Skewness	0.458
Mean of logged Data	2.263	SD of logged Data	0.118

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		95% UCLs (Adjusted for Skewness)	
95% Student's-t UCL	10.61	95% Adjusted-CLT UCL (Chen-1995)	10.53
		95% Modified-t UCL (Johnson-1978)	10.62

Nonparametric Distribution Free UCLs

95% CLT UCL	10.44	95% Jackknife UCL	10.61
95% Standard Bootstrap UCL	10.36	95% Bootstrap-t UCL	10.86
95% Hall's Bootstrap UCL	10.51	95% Percentile Bootstrap UCL	10.38
95% BCA Bootstrap UCL	10.41		
90% Chebyshev(Mean, Sd) UCL	11.07	95% Chebyshev(Mean, Sd) UCL	11.71
97.5% Chebyshev(Mean, Sd) UCL	12.59	99% Chebyshev(Mean, Sd) UCL	14.33

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

LEAD

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	7.7	Mean	8.327
Maximum	8.9	Median	8.42
SD	0.418	Std. Error of Mean	0.171
Coefficient of Variation	0.0502	Skewness	-0.316
Mean of logged Data	2.118	SD of logged Data	0.0505

Note: Sample size is small (e.g., <10), if data are collected using ISM approach

you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	8.67	95% Adjusted-CLT UCL (Chen-1995)	8.584
		95% Modified-t UCL (Johnson-1978)	8.667

Nonparametric Distribution Free UCLs

95% CLT UCL	8.607	95% Jackknife UCL	8.67
95% Standard Bootstrap UCL	8.586	95% Bootstrap-t UCL	8.651
95% Hall's Bootstrap UCL	8.583	95% Percentile Bootstrap UCL	8.582
95% BCA Bootstrap UCL	8.552		
90% Chebyshev(Mean, Sd) UCL	8.838	95% Chebyshev(Mean, Sd) UCL	9.07
97.5% Chebyshev(Mean, Sd) UCL	9.392	99% Chebyshev(Mean, Sd) UCL	10.02

Suggested UCL to Use
Data appear Normal, May want to try Normal Distribution

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

ZINC

General Statistics

Total Number of Observations	6	Number of Distinct Observations	6
		Number of Missing Observations	0
Minimum	32.6	Mean	36.27
Maximum	40.1	Median	35.75
SD	2.59	Std. Error of Mean	1.058
Coefficient of Variation	0.0714	Skewness	0.22
Mean of logged Data	3.589	SD of logged Data	0.0713

Note: Sample size is small (e.g., <10), if data are collected using ISM approach
you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options.

Nonparametric Distribution Free UCL Statistics
Data appear Normal Distributed at 5% Significance Level
