

Salt Watershed

Watershed Description

This watershed is composed of the Salt River drainage from its headwaters to Granite Reef Dam, excluding the Verde River drainage. This watershed can be divided into four very distinct sub-basins: White River, Black River, Tonto Creek, and the main stem Salt River.

The population of this 6,242 square mile watershed is approximately 40,500 people (2000 census), with most of this population in the Superior-Globe-Miami mining district. Land ownership is approximately: 49% Tribal, 48% federal, 2% private, and 1% state. The principal land uses are open range grazing, recreation, forestry, and mining. Nine wilderness areas have been set aside, which have restricted land uses and activities.

Elevations range from 10,600 feet (above sea level) in the White Mountains, to about 2,000 feet at Granite Reef Dam. The watershed above Roosevelt Lake (White River, Black River, and Tonto Creek) is above 5,000 feet elevation with high desert flora and fauna, and coldwater aquatic communities where perennial waters exist. The area below Roosevelt Lake is below 5,000 feet, and therefore, contains primarily warmwater aquatic communities.

Water Resources

This Watershed receives more precipitation than most of the state, with approximately 20 inches of rain and 20 inches of snowfall. Roosevelt Lake and a chain of other reservoirs (Apache, Canyon, and Saguaro) were constructed to store perennial flow from this watershed and provide much of the water used in the Phoenix metropolitan area.

An estimate of surface water resources in the Salt Watershed is provided in the following table. Waters on Tribal lands are not assessed by ADEQ; therefore, those statistics are shown separately.

Estimated Surface Water Resources in the Salt Watershed

	Perennial	Intermittent	Ephemeral
Stream miles	510	1,190	2,785
Lake acres	25,544	0	

Additional Surface Water Resources Locate on Tribal Lands - Not Assessed

	Perennial	Intermittent	Ephemeral
Stream miles On Tribal Lands	825	0	4,275
Lake acres On Tribal Lands	1,858	0	

Ambient monitoring focuses on perennial waters; however, special investigations may identify water quality problems on intermittent and even ephemeral waters. Estimated miles and acres are based on USGS digitized hydrology at 1:100,000 and have been rounded to the nearest 5 miles or 5 acres.

Assessments

The Salt Watershed can be separated into the following drainage areas (subwatersheds):

- 15060101 Black River
- 15060102 White River (Tribal land - Not assessed)
- 15060103 Upper Salt River
- 15060104 Carrizo Creek (Tribal land - Not assessed)
- 15060105 Tonto Creek
- 15060106A Lower Salt River

These drainage areas and the surface waters assessed as "attaining" or "impaired" are illustrated on the following watershed map. Methods used to complete these assessments are described in the "Surface Water Assessment Methods and Technical Support" document.

(1) Mercury	(43-45) Ammonia, nitrite/nitrate, nitrogen, phosphorus, total Kjeldahl nitrogen	(39-45) Dissolved oxygen, <i>E. coli</i> , pH, total dissolved solids, fish tissue mercury

Data Gaps and Monitoring Needs

Exceedances Needing More Samples to Assess	None
Missing Core Parameters	Zinc (dissolved), cadmium (dissolved), copper (dissolved), boron, manganese, copper, lead
Missing Seasonal Distribution	Zinc (dissolved), dissolved oxygen, pH, nitrogen, phosphorus, cadmium (dissolved), copper (dissolved), <i>E. coli</i> , boron, manganese, copper, lead
Lab Detection Limits Not Low Enough	None

Priority	Monitoring Recommendations
High	Collect more samples in support of TMDL development and effectiveness monitoring. Collect core parameters to represent at least 3 seasons during an assessment period.

Impairment Discussion
There was only one nitrogen exceedance in 23 aggregated samples - nitrogen is delisted from the 303(d) list. The reach remains not attaining for <i>E. coli</i> (TMDL completed in 2004) and impaired for fish tissue mercury (EPA overfile in 2010). Fish consumption advisory issued in July 2011 and still in effect.

Attaining some uses

Priority	Monitoring Recommendations
Medium	Collect another macroinvertebrate sample to confirm biocriteria violation. Collect more dissolved oxygen and nitrogen samples due to exceedances. Use lower reporting limits for dissolved cadmium and dissolved copper - all samples had reporting limits greater than chronic criteria.
